## TEC( ©)Westinghouse

Read all operating instructions before installing, connecting (wiring), operating, servicing, or inspecting the inverter.
$\square$ Ensure that this manual is made available to the end user of the inverter.

Store this manual in a safe, convenient location.
The manual is subject to change without prior notice.

6.3 Reference from Serial Communication RS485 ..... 6-4
6.4 Reference from Pulse Input ..... 6-6
6.5 Reference from two Analog Inputs ..... 6-7
6.6 Change Frequency Unit from Hz to rpm ..... 6-7
Chapter 7 Operation Method Configuration (Run / Stop) ..... 7-1
7.1 Run / Stop from the LED/ LCD Keypad ..... 7-1
7.2 Run / Stop from External Switch / Contact or Pushbutton ..... 7-2
7.3 Run / Stop from Serial Communication RS485 ..... 7-4
Chapter 8 Motor and Application Specific Settings ..... 8-1
8.1 Set Motor Nameplate Data ..... 8-1
8.2 Acceleration and Deceleration Time ..... 8-2
8.3 Torque Compensation Gain ..... 8-3
8.4 Automatic Energy Saving Functions ..... 8-4
8.5 Emergency Stop ..... 8-6
8.6 Forward and Reverse Jog ..... 8-7
8.7 Direct / Unattended Startup ..... 8-7
8.8 Analog Output Setup ..... 8-8
Chapter 9 Using PID Control for Constant Flow / Pressure Applications ..... 9-1
9.1 What is PID Control ..... 9-1
9.2 Connect Transducer Feedback Signal ..... 9-3
9.3 Engineering Units ..... 9-4
9.4 Sleep / Wakeup Function ..... 9-5
Chapter 10 Troubleshooting and Fault Diagnostics ..... 10-1
10.1 General ..... 10-1
10.2 Fault Detection Function ..... 10-1
10.3 Warning / Self-diagnosis Detection Function ..... 10-7
10.4 Auto-tuning Error ..... 10-17
10.5 PM Motor Auto-tuning Error ..... 10-18
10.6 General troubleshooting ..... 10-19
10.7 Troubleshooting of the Inverter ..... 10-20
10.7.1 Quick troubleshooting of the Inverter ..... 10-20
10.7.2 Troubleshooting for OC, OL error displays ..... 10-22
10.7.3 Troubleshooting for OV, LV error ..... 10-23
10.7.4 The motor can not run ..... 10-24
10.7.5 Motor Overheating ..... 10-25
10.7.6 Motor runs unbalanced ..... 10-26
10.8 Routine and periodic inspection ..... 10-27
10.9 Maintenance ..... 10-28
Chapter 11 Inverter Peripheral Devices and Options ..... 11-1
11.1 Braking Resistors and Braking Units ..... 11-1
11.2 AC Line Reactors ..... 11-6
11.3 Input Noise Filters ..... 11-6
11.4 Input Current and Fuse Specifications ..... 11-7
11.5 PG Speed Feedback Card ..... 11-10
11.6 Other Options ..... 11-16
11.7 NEMA1 Kit ..... 11-18
Appendix A: Communication Networks ..... A1-1
A1.1 RS485-- Network (Modbus) ..... A1-1
A1.2 Profibus DP Network ..... A1-2
Appendix B: UL Instructions ..... B-1

## Preface

The A510 product is an inverter designed to control a three-phase induction motor. Please read this manual carefully to ensure correct operation, safety and to become familiar with the inverter functions.

The A510 inverter is an electrical / electronic product and must be installed and handled by qualified service personnel.

Improper handling may result in incorrect operation, shorter life cycle, or failure of this product as well as the motor.

All A510 documentation is subject to change without notice. Be sure to obtain the latest editions for use or visit our website at www.tecowestinghouse.com

Available Documentation:

1. A510 Start-up and Installation Manual
2. A510 Instruction Manual

Ensure you have sound knowledge of the device and familiarize yourself with all safety information and precautions before proceeding to operate the inverter.

Ensure you have sound knowledge of the inverter and familiarize yourself with all safety information and precautions before proceeding to operate the inverter.

Please pay close attention to the safety precautions indicated by the warning
 and caution ! symbol.

| Warning | Failure to ignore the information indicated by the warning symbol may <br> result in death or serious injury. |
| :--- | :--- |
| $\Lambda$ Caution | Failure to ignore the information indicated by the caution symbol may <br> result in minor or moderate injury and/or substantial property damage. |

## Chapter 1 Safety Precautions

### 1.1 Before Supplying Power to the Inverter

Warning

- The main circuit must be correctly wired. For single phase supply use input terminals (R/L1, T/L3) and for three phase supply use input terminals (R/L1, S/L2, T/L3). Terminals U/T1, $\mathrm{V} / \mathrm{T} 2, \mathrm{~W} / \mathrm{T} 3$ must only be used to connect the motor. Connecting the input supply to any of the U/T1, V/T2 or W/T3 terminals will cause damage to the inverter.

## Caution

- To avoid the front cover from disengaging or other physical damage, do not carry the inverter by its cover. Support the unit by its heat sink when transporting. Improper handling can damage the inverter or injure personnel, and should be avoided.
- To avoid the risk of fire, do not install the inverter on or near flammable objects. Install on nonflammable objects such as metal surfaces.
- If several inverters are placed inside the same control panel, provide adequate ventilation to maintain the temperature below $40^{\circ} \mathrm{C} / 104^{\circ} \mathrm{F}\left(50^{\circ} \mathrm{C} / 122^{\circ} \mathrm{F}\right.$ without a dust cover) to avoid overheating or fire.
- When removing or installing the digital operator, turn off the power first, and then follow the instructions in our instruction manual to avoid operator error or loss of display caused by faulty connections.

## 全 Warning

- This product is sold subject to IEC $61800-3$. In a domestic environment this product may cause radio interference in which case the user may need to apply corrective measures.
- Motor over temperature protection is provided.

### 1.2Wiring

## Warning

- Always turn OFF the power supply before attempting inverter installation and wiring of the user terminals.
- Wiring must be performed by a qualified personnel / certified electrician.
- Make sure the inverter is properly grounded. (220V Class: Grounding impedance shall be less than $100 \Omega$. 460 V Class: Grounding impedance shall be less than $10 \Omega$.)
- Make sure the inverter is properly grounded. It is required to disconnect the ground wire in the control board to avoid the sudden surge causing damage on electronic parts if it is improperly grounded.
- RCD is required to be in compliance with the protection norm of B-type leakage current.
- Please check and test emergency stop circuits after wiring. (Installer is responsible for the correct wiring.)
- Never touch any of the input or output power lines directly or allow any input of output power lines to come in contact with the inverter case.
- Do not perform a dielectric voltage withstand test (megger) on the inverter this will result in inverter damage to the semiconductor components.

## Caution

- The line voltage applied must comply with the inverter's specified input voltage. (See product nameplate section 2.1)
- Connect braking resistor and braking unit to the designated terminals. (See power terminals section 3.10)
- Do not connect a braking resistor directly to the DC terminals $P(+)$ and $N(-)$, otherwise fire may result.
- Use wire gauge recommendations and torque specifications. See wire guage and torque specification section 3.6)
- Never connect input power to the inverter output terminals U/T1, V/T2, W/T3.
- Do not connect a contactor or switch in series with the inverter and the motor.
- Do not connect a power factor correction capacitor or surge suppressor to the inverter output.
- Ensure the interference generated by the inverter and motor does not affect peripheral devices.

### 1.3Before Operation

## Warning

- Make sure the inverter capacity matches the parameters 13-00.
- Reduce the carrier frequency (parameter 11-01) If the cable from the inverter to the motor is greater than $80 \mathrm{ft}(25 \mathrm{~m})$. A high-frequency current can be generated by stray capacitance between the cables and result in an overcurrent trip of the inverter, an increase in leakage current, or an inaccurate current readout.
- Be sure to install all covers before turning on power. Do not remove any of the covers while power to the inverter is on, otherwise electric shock may occur.
- Do not operate switches with wet hands, otherwise electric shock may result.
- Do not touch inverter terminals when energized even if inverter has stopped, otherwise electric shock may result.

### 1.4Parameters Setting

## Caution

- Do not connect a load to the motor while performing a rotational auto-tune.
- Make sure the motor can freely run and there is sufficient space around the motor when performing a rotational auto-tune.

### 1.5Operation

## Warning

- Be sure to install all covers before turning on power. Do not remove any of the covers while power to the inverter is on, otherwise electric shock may occur.
- Do not connect or disconnect the motor during operation. This will cause the inverter to trip and may cause damage to the inverter.
- Operations may start suddenly if an alarm or fault is reset with a run command active. Confirm that no run command is active upon resetting the alarm or fault, otherwise accidents may occur.
- Do not operate switches with wet hands, otherwise electric shock may result.
- It provides an independent external hardware emergency switch, which emergently shuts down the inverter output in the case of danger.
- If automatic restart after power recovery (parameter 07-00) is enabled, the inverter will start automatically after power is restored.
- Make sure it is safe to operate the inverter and motor before performing a rotational auto-tune.
- Do not touch inverter terminals when energized even if inverter has stopped, otherwise electric shock may result.
- Do not check signals on circuit boards while the inverter is running.

After the power is turned off, the cooling fan may continue to run for some time.

## Caution

- Do not touch heat-generating components such as heat sinks and braking resistors.
- Carefully check the performance of motor or machine before operating at high speed, otherwise Injury may result.
- Note the parameter settings related to the braking unit when applicable.
- Do not use the inverter braking function for mechanical holding, otherwise injury may result. Do not check signals on circuit boards while the inverter is running.

### 1.6 Maintenance, Inspection and Replacement

## Warning

- Wait a minimum of five minutes after power has been turned OFF before starting an inspection. Also confirm that the charge light is OFF and that the DC bus voltage has dropped below 25 Vdc .
- Never touch high voltage terminals in the inverter.
- Make sure power to the inverter is disconnected before disassembling the inverter.
- Only authorized personnel should perform maintenance, inspection, and replacement operations. (Take off metal jewelry such as watches and rings and use insulated tools.)

## Caution

- The Inverter can be used in an environment with a temperature range from $14^{\circ} \sim 104(140)^{\circ} \mathrm{F}$ $\left(-10 \sim+40(60)^{\circ} \mathrm{C}\right)$ and relative humidity of $95 \%$ non-condensing.
- The inverter must be operated in a dust, gas, mist and moisture free environment.

### 1.7 Disposal of the Inverter

## 4 Caution

- Please dispose of this unit with care as an industrial waste and according to your required local regulations.
- The capacitors of inverter main circuit and printed circuit board are considered as hazardous waste and must not be burned.
- The Plastic enclosure and parts of the inverter such as the top cover board will release harmful gases if burned.

Equipment containing electrical components may not be disposed of together with domestic waste. It must be separately collected with electrical and electronic waste according to local and currently valid legislation.

## Chapter 2 Model Description

### 2.1 Nameplate Data

It is essential to verify the A510 inverter nameplate and make sure that the A510 inverter has the correct rating so it can be used in your application with the proper sized AC motor.

## Unpack the A510 inverter and check the following:

(1) The A510 inverter and start-up and installation manual are contained in the package.
(2) The A510 inverter has not been damaged during transportation there should be no dents or parts missing.
(3) The A510 inverter is the type you ordered. You can check the type and specifications on the main nameplate.
(4) Check that the input voltage range meets the input power requirements.
(5) Ensure that the motor HP matches the motor rating of the inverter.

HD: Heavy Duty (Constant Torque); ND: Normal Duty (Variable Torque) (1HP = 0.746 kW )

Model Identification

## Chapter 3 Environment and Installation

### 3.1 Environment

The environment will directly affect the proper operation and the life span of the inverter. To ensure that the inverter will give maximum service life, please comply with the following environmental conditions:

| Protection |  |
| :---: | :---: |
| Protection Class | IP20/IP21/NEMA 1 or IP00 |
| Operating Temperature | IP20/IP21:-10 ${ }^{\circ} \mathrm{C}-+40^{\circ} \mathrm{C}\left(14-104{ }^{\circ} \mathrm{F}\right)$ <br> IP00 or without cover: $-10^{\circ} \mathrm{C}-+50^{\circ} \mathrm{C}\left(14-122^{\circ} \mathrm{F}\right)$ <br> Enhanced type frame 5 is $50^{\circ} \mathrm{C}$ without de-rating. <br> The maximum operating temperature is $60^{\circ} \mathbf{C}$, but it is required to derate $2 \%$ of current at each additional $1^{\circ} \mathrm{C}$. <br> If several inverters are placed in the same control panel, provide a heat removal means to maintain ambient temperatures |
| Storage Temperature | $-20^{\circ} \mathrm{C}-+70^{\circ} \mathrm{C}\left(-4-150^{\circ} \mathrm{F}\right)$ |
| Humidity | $95 \%$ non-condensing Relative humidity $5 \%$ to $95 \%$, free of moisture. (Follow IEC60068-2-78 standard) |
| Altitude | Altitude: Below 1000 m ( 3281 ft .) <br> It is required to derate $1 \%$ of current at each additional 100 m . The maximum altitude is $\mathbf{3 0 0 0} \mathbf{~ m}$. |
| Installation Site | Avoid exposure to rain or moisture. |
|  | Avoid direct sunlight. |
|  | Avoid oil mist and salinity. |
|  | Avoid corrosive liquid and gas. |
|  | Avoid dust, lint fibers, and small metal filings. |
|  | Keep away from radioactive and flammable materials. |
|  | Avoid electromagnetic interference (soldering machines, power machines). |
|  | Avoid vibration (stamping, punching machines etc.). <br> Add a vibration-proof pad if the situation cannot be avoided. |
| Shock | Maximum acceleration: 1.0G ( $9.8 \mathrm{~m} / \mathrm{s}^{2}$ ), from 49.84 to 150 Hz Displacement amplitude : 0.3 mm (peak value), from 10 to 49.84 Hz (Follow IEC60068-2-6 standard) |

### 3.2 Installation

When installing the inverter, ensure that inverter is installed in upright position (vertical direction) and there is adequate space around the unit to allow normal heat dissipation as per the following Fig. 3.2.1

Fig 3.2.1: A510s Installation space

X = 1.18" (30mm) for inverter ratings up to 25HP $X=1.96^{\prime \prime}(50 \mathrm{~mm})$ for inverter ratings 30HP or higher

Important Note: The inverter heatsink temperature can reach up to $194^{\circ} \mathrm{F} / 90^{\circ} \mathrm{C}$ during operation; make sure to use insulation material rated for this temperature.

### 3.3 External View

(a) 200 V 1 ~ $7.5 \mathrm{HP} / 400 \mathrm{~V} 1 \sim 7.5 \mathrm{HP} / 575 \mathrm{~V} 1 \sim 3 \mathrm{HP}$

(Wall-mounted type, IEC IP20)

(Wall-mounted type, IEC IP20, NEMA1)
(b) 200 V 10 ~ $25 \mathrm{HP} / 400 \mathrm{~V} 10$ ~ $30 \mathrm{HP} / 575 \mathrm{~V}$ 5~10HP / 690V 15~40HP

(Wall-mounted type, IEC IP20)

(Wall-mounted type, IEC IP20, NEMA1)
(c) 200 V 30 ~ $40 \mathrm{HP} / 400 \mathrm{~V} 40$ ~ $75 \mathrm{HP} / 690 \mathrm{~V} 50 \sim 75 \mathrm{HP}$

(Wall-mounted type, IEC IP20, NEMA1)
(d) 200 V 50 ~ 100 HP / 400V 100 ~ 215 HP / 690V 100~270HP

(Wall-mounted type, IEC IP00)

(Wall-mounted type, IEC IP20, NEMA1)
(e) 200 V 125 ~ $150 \mathrm{HP} / 400 \mathrm{~V} 270$ ~ 425 HP

### 3.4 Warning Labels

Important: Warning information located on the front cover must be read upon installation of the inverter.

## ^ WARNING / AVERTISSEMENT

Risk of electrical shock. shut off main power and wait for 5 minutes before servicing.
Risque de choc électrique. Couper l'alimentation principale et attendre 5 minutes avant I'entretien.
Hot surface. Risk of burn.
Surface chaude. Risque de brûlure.
$\triangle$ CAUTION / ATTENTION
see manual before operation.
Consultez le manuel avant l'opération.
(a) 200V: 1-7.5HP / 400V: 1-7.5HP /575V 1~ 3 HP

## $\triangle$ WARNING / AVERTISSEMENT

Risk of electrical shock. shut off main power and wait for 5 minutes before servicing.
Risque de choc électrique. Couper l'alimentation principale et attendre 5 minutes avant I'entretien.
. CAUTION / ATTENTION
See manual before operation.
Consultez le manuel avant I'opération.
(b) 200V: 10HP / 400V: 10-20HP /575V 5~10HP

## . WARNING / AVERTISSEMENT

Risk of electrical shock. shut off main power and wait for 15 minutes before servicing.
4. Risque de choc électrique. Couper l'alimentation principale et attendre 15 minutes avant I'entretien.
$\triangle$ CAUTION / ATTENTION
See manual before operation.
Consultez le manuel avant l'opération.
(c) 200V: 15-150HP / 400V: 20(F)-425HP/690V 15~270HP

### 3.5 Removing the Front Cover and Keypad

## 1 ! Caution

- Before making any wiring connections to the inverter the front cover needs to be removed.
- It is not required to remove the digital operator before making any wiring connections.
- Models 200V, $1-25 \mathrm{HP}$ and 400V, 1 - 30 HP and 575V/690V $1-40 \mathrm{HP}$ have a plastic cover. Loosen the screws and remove the cover to gain access to the terminals and make wiring connections. Place the plastic cover back and fasten screws when wiring connections have been made.
- Models 200V, 30-150HP and 400V, 40-425HP and 690V $50-270 \mathrm{HP}$ have a metal cover. Loosen the screws and remove the cover to gain access to the terminals and make wiring connections. Place the metal cover back and fasten screws when wiring connections have been made.

### 3.5.1 Without Built-in filter type (U Type)

(a) 200V: 1 ~ 7.5 HP / 400V: 1 ~ 7.5 HP /575V: 1~3HP

Step 1: Unscrew

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw
(b) 200V: 10 ~ 25 HP / 400V: 10 ~ 30 HP /575V: 5~10HP/690V 15~40HP

Step 1: Unscrew cover

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw
(c) 200V: $30 \sim 40$ HP / 400V: $40 \sim 75$ HP /690V: 50~75HP (Chassis Type)

Step 1: Unscrew cover

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw
(d) 200V: 50 ~ 100 HP / 400V: 100 ~ 215 HP /690V: 100~270HP (Chassis Type)

Step 1: Unscrew cover

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw
(e) 200V: 125 ~ 150 HP / 400V: 270 ~ 425 HP (Chassis Type)

Step 1: Unscrew cover

Step 2: Remove cover

Step 3: Make wire connections and place cover back

Step 4: Fasten screw

### 3.5.2 Built-in filter type (400V: 1 ~ 60 HP )

Step 1: Unscrew cover

Step 3: Unscrew filter section

Step 5: Make connections and place filter cover back

Step 6: Fasten screw
***Filter Type Not Standard in US Market***

### 3.6 Wire Gauges and Tightening Torque

To comply with UL standards, use UL approved copper wires (rated $75^{\circ} \mathrm{C}$ ) and round crimp terminals (UL Listed products) as shown in table below when connecting to the main circuit terminals. TECO recommends using crimp terminals manufactured by NICHIFU Terminal Industry Co., Ltd and the terminal crimping tool recommended by the manufacturer for crimping terminals and the insulating sleeve.

| $\begin{gathered} \text { Wire size } \\ \mathrm{mm}^{2}(\mathrm{AWG}) \end{gathered}$ | Terminal screw size | Model of the round crimp terminal | Fastening torque kgf.cm (in.lbs) | Model of insulating sleeve | Model of crimp tool |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 3.7 Wiring Peripheral Power Devices

## Caution

- After power is shut off to the inverter the capacitors will slowly discharge. Do NOT touch the inverter circuit or replace any components until the "CHARGE" indicator is off.
- Do NOT wire or connect/disconnect internal connectors of the inverter when the inverter is powered up or after power off but the "CHARGE"" indicator is on.
- Do NOT connect inverter output $\mathrm{U}, \mathrm{V}$ and W to the AC power source. This will result in damage to the inverter.
- The inverter must be properly grounded. Use terminal $E$ to connect earth ground and comply with local standards.
- It is required to disconnect the ground wire in the control board if the inverter is not grounded.
- Do NOT perform a dielectric voltage withstand test (Megger) on the inverter this will result in inverter damage to the semiconductor components.
- Do NOT touch any of the components on the inverter control board to prevent damage to the inverter by static electricity.

200V: 1HP~2HP/ 400V: 1HP~3HP

200V: 10HP/ 400V: 10~20HP/575V: 5~10HP

200V: 30-40HP/ 400V: 40-75HP/690V: 50~75HP

- Disconnect the ground screw below the $\mathbf{C} / \mathrm{B}$ and ground studs of isolated metal plate.

## Caution

- Refer to the recommended wire size table for the appropriate wire to use. The voltage between the power supply and the input terminals of the inverter may not exceed $2 \%$.

```
Phase-to-phase voltage drop (V)=\sqrt{}{3}\timesresistance of wire (\Omega/km) \times length of line m)
x current }\times1\mp@subsup{0}{}{-3}\mathrm{ .
(km=3280 x feet) / (m=3.28 x feet )
```

- Reduce the carrier frequency (parameter 11-01) If the cable from the inverter to the motor is over 25 m ( 82 ft ). A high-frequency current can be generated by stray capacitance between the cables and result in an overcurrent trip of the inverter, an increase in leakage current, or an inaccurate current readout.
- To protect peripheral equipment, install fast acting fuses on the input side of the inverter. Refer to section 11.4 for additional information.

### 3.8.1 General Wiring Diagram (For U Type)

Notes:
*1: Models 230V $1 \sim 25 \mathrm{HP}$ and 460V $1 \sim 40 \mathrm{HP}$ or lower ratings have a built-in braking transistor. To use this braking transistor a braking resistor can be connected between B1 and B2.
*2: Use SW3 to select between Sink (NPN, with 24VG common) or Source (PNP, with +24 V common) for multi-function digital input terminals S1~S8.
*3: Use SW2 to switch between voltage ( $0 \sim 10 \mathrm{~V}$ ) and current ( $4 \sim 20 \mathrm{~mA}$ ) input for Multi-function analog input 2 (AI2). Besides please also check parameter 04-00 for proper setting.
*4: Run Permissive input F1 and F2 is a normally closed input. This input should be closed to enable the inverter output. To activate this input remove the jumper wire between F1 and F2.
*5: Models 230V 3HP and 460V 5HP and higher ratings include terminals -10V, S(+), S(-),R2A-R2C and PO-GND.
*6: 230V 2HP and 460V 3HP and lower ratings include terminal DO2.
*7: When using the open collector for pulse input, it doesn't need resistance because of built-in pull-up resistance.
*8: AO2 default setting is $0 \sim+10 \mathrm{~V}$.
*9: Both 230 V class 50HP~150HP and 460V class 100HP~425HP have built-in DC reactors.
*10: It need turn on the switch for the terminal resistor RS485 in the last inverter when many inverters in parallel connection.
Please refer to Appendix A (Communication Addendum)

### 3.8.2 General Wiring Diagram (For UE Type)

## Notes:

*1: Models 230V $1 \sim 25 \mathrm{HP}$ and 460V 1~30HP or lower ratings have a built-in braking transistor. To use this braking transistor a braking resistor can be connected between B1 and B2.
*2: Use SW6 to select between Sink (NPN, with 24VG common) or Source (PNP, with +24 V common) for multi-function digital input terminals S1~S8.
*3: Use SW3/SW4 to switch between voltage ( $0 \sim 10 \mathrm{~V}$ ) and current ( $4 \sim 20 \mathrm{~mA}$ ) input for Multi-function analog input 2 (Al2). Besides please also check parameter 04-00 for proper setting.
*4: Run Permissive input SF1 and SF2 is a normally closed input. This input should be closed to enable the inverter output. To activate this input remove the jumper wire between SF1/ SF2 and SG.
*5: When using the open collector for pulse input, it doesn't need resistance because of built-in pull-up resistance.
*6: AO1/AO2 default setting is $0 \sim+10 \mathrm{~V}$.
*7: Both 230 V class 50HP~150HP and 460V class $100 \mathrm{HP} \sim 425 \mathrm{HP}$ have built-in DC reactors.
*8: It need turn on the switch for the terminal resistor RS485 in the last inverter when many inverters in parallel connection.

### 3.11 Input / Output Power Section Block Diagram

The following diagrams $1-8$ show the basic configuration of the power sections for the range of horsepower and input voltages. This is shown for reference only and is not a detailed depiction.

1: 230V: 1 HP / 460V: 1 ~ 2 HP

2: 230V: 2 ~ 25 HP / 460V: 3 ~ 40 HP (U Type) /460V: 3 ~ 30 HP (UE Type)
575V:1~10HP / 690V: 15~40HP

3: 230V: 30 ~ 40 HP / 460V: $50 \sim 75$ HP (U Type) /460V: $40 \sim 75$ HP (UE Type)

4: 690V: 50~75HP

5: 230V: 50 ~ 60 HP / 460V: 100 ~ 215 HP

6: 690V: 100~150HP

7: 230V: 75, $100 \mathrm{HP}, 125,150 \mathrm{HP}$

8: 460V: 270HP, 300HP, 375HP, 425 HP / 690V: 175~270HP

### 3.11.1 Cooling Fan Supply Voltage Selection (460V class)

The inverter input voltage range of the A510 460V class models ranges from 380 to 480 Vac . In these models the cooling fan is directly powered from the power supply. Inverter models A510-4215(F8)/ 4270/4300/4375/ 4425 requires the user to select the correct jumper position based on the inverter input voltage ("460V" is the default position for these models). Please select the correct position according to the input voltage. If the voltage setting is too low, the cooling fan will not provide adequate cooling for the inverter resulting in an over-heat error. If the input voltage is greater than 460 Vac , select the "460V" position.
(1) 460V: $270 \mathrm{HP} \sim 425 \mathrm{HP}$

For example, input voltage is 460 Vac , jumper pin needs to put in " 460 V " position.

The inverter input voltage range of the A510 600V class models ranges from 575 to 690Vac. In these models the cooling fan is directly powered from the power supply. Inverter models A510-6175~6270 requires the user to select the correct jumper position based on the inverter input voltage (" 690 V " is the default position for these models). Please select the correct position according to the input voltage. If the voltage setting is too low, the cooling fan will not provide adequate cooling for the inverter resulting in an over-heat error. If the input voltage is greater than 690 Vac , select the " 690 V " position.
(2) 690V: 175HP~270HP

| Input voltage range Vac | Voltage selection board position |
| :---: | :---: |
| $510 \sim 600$ | 575 V |
| $601 \sim 660$ | 630 V |
| $661 \sim 720$ | 690 V |
| $721 \sim 759$ | 760 V |

### 3.12 Inverter Wiring

## Wiring Precautions

| ! Danger | - Do NOT remove any protective covers or attempt any wiring while input power is <br> applied. Connect all wiring before applying input power. When making wiring <br> changes after power up, remove input power and wait a minimum of five minutes <br> after power has been turned off before starting. Also confirm that the charge <br> lamp is off and that DC voltage between terminals B1/P or (+) and (-) does not <br> exceed 25V, otherwise electric shock may result. <br> - Only authorized personnel should work on the equipment. (Take off metal <br> jewelry such as watches and rings and use insulated tools.), otherwise electric <br> shock or injury may result. |
| :---: | :--- |

(A) Power input terminals

1. The Input power supply voltage can be connected in any phase sequence to power input terminals R/L1, S/L2, or T/L3 on the terminal block.
2. DO NOT connect the AC input power source to the output terminals $\mathrm{U} / \mathrm{T} 1, \mathrm{~V} / \mathrm{T} 2$ and. $\mathrm{W} / \mathrm{T} 3$.
3. Connect the output terminals $\mathrm{U} / \mathrm{T} 1, \mathrm{~V} / \mathrm{T} 2, \mathrm{~W} / \mathrm{T} 3$ to motor lead wires $\mathrm{U} / \mathrm{T} 1, \mathrm{~V} / \mathrm{T} 2$, and $\mathrm{W} / \mathrm{T} 3$, respectively.
4. Check that the motor rotates forward with the forward run source. If it does not, swap any 2 of the output cables to change motor direction.
5. DO NOT connect phase correcting capacitors or LC/RC noise filter to the output circuit.
(B) Grounding
6. Connect the ground terminal ( E ) to ground having a resistance of less than $100 \Omega$.
7. Do not share the ground wire with other devices, such as welding machines or power tools.
8. Always use a ground wire that complies with the local codes and standards for electrical equipment and minimize the length of ground wire.
9. When using more than one inverter, be careful not to loop the ground wire, as shown below in Fig. 3.12.1.

Fig. 3.12.1 Inverter Grounding

### 3.13 Input Power and Motor Cable Length

The length of the cables between the input power source and /or the motor and inverter can cause a significant phase to phase voltage reduction due to the voltage drop across the cables. The wire size shown in Tables 3.16 .1 is based on a maximum voltage drop of $2 \%$. If this value is exceeded, a wire size having larger diameter may be needed. To calculate phase tot phase voltage drop, apply the following formula:

Phase-to-phase voltage drop $(\mathrm{V})=\sqrt{3} \times$ resistance of wire $(\Omega / \mathrm{km}) \times$ length of line $(\mathrm{m}) \times$ current (A) $\times 10^{-3}$.
( $k m=3280 \times$ feet $)$
( $\mathrm{m}=3.28 \mathrm{x}$ feet)

### 3.14 Cable Length vs. Carrier Frequency

The allowable setting of the PWM carrier frequency is also determined by motor cable length and is specified in the following Table 3.14.1.

Table 3.14.1 Cable Length vs. Carrier Frequency

| Cable length between the inverter and Motor in m ( ft .). | $\begin{aligned} & <30 \mathrm{~m} \\ & (100) \end{aligned}$ | $\begin{gathered} 30-50 \\ (100-165) \end{gathered}$ | $\begin{gathered} 50-100 \\ (166-328) \end{gathered}$ | $\begin{aligned} & \geq 100 \\ & (329) \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: |
| Recommended carrier frequency allowed Parameter 11-01 | 16 kHz (max) | $\underset{(\max )}{10 \mathrm{kHz}}$ | $\begin{aligned} & 5 \mathrm{kHz} \\ & (\max ) \end{aligned}$ | $\begin{aligned} & 2 \mathrm{kHz} \\ & (\max ) \end{aligned}$ |

### 3.15 Installing an AC Line Reactor

If the inverter is connected to a large-capacity power source (600kVA or more), install an optional AC reactor on the input side of the inverter. This also improves the power factor on the power supply side.

### 3.16 Power Input Wire Size, NFB and MCB Part Numbers

The following table shows the recommended wire size, molded case circuit breakers and magnetic contactors for each of the A510 models. It depends on the application whether or not to install a circuit breaker. The NFB must be installed between the input power supply and the inverter input (R/L1, S/L2, T/L3).

Note: When using a ground protection make sure the current setting is above 200 mA and trip delay time is 0.1 sec of higher.

Table 3.16.1 Wiring instrument for $230 \mathrm{~V} / 460 \mathrm{~V}$ class

| A510 Model |  |  |  | wire diameter ( $\mathrm{mm}^{2}$ ) |  |  | NFB ${ }^{*}$ | MC ${ }^{* 4}$ |

*1: Constant torque rating.
*2: The main circuit terminals: R/L1, S/L2, T/L3, U/T1, V/T2, W/T3, B1 / P, B2, Ө, 也
*3: Control line is the terminal wire on the control board.
*4: The NFB and MCB listed in the table are of TECO product numbers, products with same rated specification of other brands may be used. To reduce electrical noise interference, ensure that a RC surge absorber (R: 10 / $5 \mathrm{~W}, \mathrm{C}: 0.1 \mu \mathrm{f} / 1000 \mathrm{VDC}$ ) is added to both sides of MCB coil.

### 3.17 Control Circuit Wiring

(1) Separate the wiring for control circuit terminals from main circuit wiring for terminals (R/L1, S/L2, T/L3, U/T1, V/T2, W/T3).
(2) Separate the wiring for control circuit terminals R1A-R1B-R1C (or R2A, R2C) (Relay outputs) from wiring for terminals © - ® , A01, A02, GND, DO1, DO2, DOG, +10V, (-10V), Al1, Al2 and GND wiring.
(3) Use shielded twisted-pair cables (\#24-\#14 AWG / 0.5-2 mm²) shown in Fig. 3.17.1 for control circuits to minimize noise problems. The maximum wiring distance should not exceed 50m ( 165 $\mathrm{ft})$.

Fig. 3.17.1 Shielded Twisted-Pair
(4) When the digital multi-function output terminals (DO1, DO2) are connected to an external relay, a freewheeling diode should be connected across the relay coil to prevent an inductive voltage spike from damaging the output circuitry as shown in Fig. 3.17.2 below.

Fig. 3.17.2 Photo-Coupler Connected to an External Relay
(5) In Section 3.8 the control boards referenced have a jumper SW3 that can select the digital input to terminals (1) - © to be set for SINK or SOURCE. The following Fig. 3.17.3 (a.) - (d.) shows examples for the various SINK / Source interfaces.

Fig. 3.17.3 Sink / Source Configurations

*1: Take TECO standard 4-pole induction motor as the base.
*2: A510 model is designed to use in heavy duty conditions, the factory setting is the HD (Heavy Duty type) mode.
*3: The overload capacity of A510 model HD (Heavy Duty) is $150 \%$ / $1 \mathrm{~min}, 200 \% / 2 \mathrm{sec}$. See the table below for the carrier frequency default setting and range.
*4: The overload capacity of A510 model ND (Normal Duty) is $120 \% / 1 \mathrm{~min}$, carrier range: $2 \mathrm{KHz} \sim 16 \mathrm{KHz}$, the default setting is 2 KHz . The default setting is 1.5 KHz for $575 / 690 \mathrm{v}$ inverter that over 215hp
*5: If it is greater than default carrier frequency, you need to adjust the load current based on the de-rating curve.

| Inverter Voltage and Capacity |  | HD mode <br> carrier frequency range | HD mode <br> carrier frequency factory setting |
| :--- | :--- | :--- | :--- |
| $\mathbf{2 3 0 V}$ class | $\mathbf{4 6 0 V}$ class |  | 8 KHz |
| $1 \sim 20 \mathrm{HP}$ | $1 \sim 30 \mathrm{HP}$ | 6 KHz |  |
| 25 HP | - | $2 \sim 12 \mathrm{KHz}$ | 5 KHz |
| $30 \sim 40 \mathrm{HP}$ | $40 \sim 50 \mathrm{HP}$ | $2 \sim 12 \mathrm{KHz} \mathrm{(*} 6)$ | 5 KHz |
| $50 \sim 100 \mathrm{HP}$ | $60 \sim 175 \mathrm{HP}$ | $2 \sim 10 \mathrm{KHz} \mathrm{(*} 6)$ | 4 KHz |

|  | PMSV | unlimited | Twice of Base frequency |
|  | PMSLV | unlimited | 599 Hz |
| Normal Duty$(00-27=1)$ | V/F $\mathrm{V} / \mathrm{F}+\mathrm{PG}$ | maximum frequency set to 120 Hz | 120 Hz |
|  | SLV /SV PMSV/ PMSLV SLV2 | No normal duty mode | - |

General Specifications

|  | Operation mode | LCD keypad with parameter copy function (Optional Seven-segment display * 5 + LED keypad) |
| :---: | :---: | :---: |
|  | Control mode | V/F, V/F+PG, SLV, SV, PMSV, PMSLV, SLV2* with space vector PWM mode |
|  | Frequency control range | $0.1 \mathrm{~Hz} \sim 599.0 \mathrm{~Hz}$ |
|  | Output frequency accuracy (Temperature change) | Digital references: $\pm 0.01 \%\left(-10\right.$ to $\left.+40^{\circ} \mathrm{C}\right) \quad$ Analog references: $\pm 0.1 \%\left(25^{\circ} \mathrm{C}\right.$ $\pm 10^{\circ} \mathrm{C}$ ) |
|  | Speed control accuracy | $\pm 0.1 \%$ ( vector control(SV)), $\pm 0.5 \%$ ( vector control / open-loop) |
|  | Frequency setting resolution | Digital references: 0.01 Hz , Analog references: $0.03 \mathrm{~Hz} / 60 \mathrm{~Hz}$ (If the maximum output frequency of motor is over 300 HZ ,the frequency resolution is changed to 0.1 Hz ) |
|  | Output frequency resolution | 0.01 Hz (If the maximum output frequency of motor is over 300 HZ ,the frequency resolution is changed to 0.1 Hz ) |
|  | Inverter overload | Rated output current $150 \% / 1 \mathrm{~min}, 200 \% / 2 \mathrm{sec}(\mathrm{HD}$ mode), $120 \% / 1 \mathrm{~min}$ (ND mode) Factory $150 \% / 1 \mathrm{~min}, 200 \% / 2 \mathrm{sec}$ |
|  | Frequency setting signal | 0 to +10VDC / 4 to 20mA or -10V to +10VDC and pulse input command frequency |
|  | Acceleration / deceleration time | $0.0-6000.0$ second (separately set acceleration and deceleration time ) |
|  | Voltage, frequency characteristics | Custom V/f curve based on parameters |
|  | Braking torque | About 20\% |
|  | Main control functions | Auto-tuning, Zero Servo, torque control, position control, Droop, Soft-PWM, over-voltage protection, dynamic braking, speed search, frequency traversing, instantaneous power fault restart, PID control, automatic torque compensation, automatic speed regulation, RS-485 communication standard, speed feedback control, simple PLC function, 2 sets of analog outputs, safety switch. |
|  | Other functions | Accumulated power-on / run time, 30 sets of fault history records and latest fault record state, energy-saving function setting, single phase protection, smart braking, DC braking, Dwell, S curve acceleration and deceleration, Up / Down operation, MODBUS protocol, pulse output, engineering units, SINK / SOURCE digital inputs, RTC function (only for UE LCD type). |
|  | Stall protection | Stall prevention level can be set independently in acceleration, deceleration and constant speed. |
|  | Instantaneous over current (OC) and output short-circuit (SC) protection | Inverter stops when the output current exceeds $200 \%$ of the inverter rated current. |
|  | Inverter overload Protection (OL2) | HD mode: If inverter rated current $150 \% / 1$ min., or $200 \% / 2$ sec is exceeded inverter stops, factory default carrier frequency setting is $8 \sim 2 \mathrm{KHz}$. ND mode: If inverter rated current $120 \% / 1$ min is exceeded inverter stops, factory default carrier frequency is 2 KHz . |
|  | Motor overload (OL1) protection | Electrical overload protection curve ${ }^{12} \mathrm{~T}$ |
|  | Over voltage(OV) protection | If the main circuit DC voltage rises over 410V (230V class) / 820V (460V class), and over 1050V (575V class) / 1230V (690V class), the motor stops running. |
|  | Under voltage (UV) | If the main circuit DC voltage falls below 190 V ( 230 V class) / 380V ( 460 V class), and 546 V (575/690V class), the motor stops running. |
|  | Automatic restart after instantaneous power fault | Power fault exceeds 15 ms . <br> Automatic restart function available after instantaneous power fault in 2 sec . |
|  | Overheat protection( OH ) | Uses temperature sensor for protection. |
|  | Ground Fault protection(GF) | Use current sensor for protection. |
|  | DC bus charge indicator | When main circuit DC voltage $\geqq 50 \mathrm{~V}$, the CHARGE LED turns on. |
|  | Input phase loss protection (IPL) | If the IPL is detected the motor stops automatically. |
|  | Output phase loss protection (OPL) | If the OPL is detected the motor stops automatically. |
|  | Short-circuit current rating (SCCR) | Per UL 508C, the drive is suitable for use on a circuit capable of delivering not more than 100KA symmetrical amperes (rms) when protected by fuses given in the fuse table |

| Environment Specification | Location |  | Indoor (protected from corrosive gases and dust). |
| :---: | :---: | :---: | :---: |
|  | Ambient temperature |  | $-10 \sim+40^{\circ} \mathrm{C}\left(14^{\circ} \mathrm{F} \sim 104^{\circ} \mathrm{F}\right)$ (IP20/IP21), $-10 \sim+50^{\circ} \mathrm{C}\left(14^{\circ} \mathrm{F} \sim 122^{\circ} \mathrm{F}\right)$ (IP00 or top anti-dust cover removed); with de-rating, its maximum operation temperature is $60^{\circ} \mathrm{C}\left(140^{\circ} \mathrm{F}\right)$ (UE type frame 5 is $50^{\circ} \mathrm{C}$ without de-rating |
|  | Storage temperature |  | $-20 \sim+70^{\circ} \mathrm{C} \quad\left(-4^{\circ} \mathrm{F} \sim+158^{\circ} \mathrm{F}\right)$ |
|  | Humidity |  | 95\%RH or less ( no condensation) |
|  | Altitude and vibration |  | Altitude of 1000m (3181ft) or below ; 1.0G, in compliance with IEC 60068-2-6 |
|  | Pollution degree |  | Meet IEC 60721-3-3 Class 3C2 |
| Communication function |  |  | RS-485 standard (MODBUS RTU / ASCII protocol) (RJ45 \& S(+), S(-) terminal) |
| PLC function |  |  | Built-in |
| EMI protection |  |  | The built-in noise filter complies with EN61800-3 available for inverters 460V 60HP or below. |
| EMS protection |  |  | EN61800-3 |
| Certification |  | CE | EN61800-3 (CE \& RE) EN61800-5-1 (LVD) |
|  |  | UL | UL508C |

### 3.19 Inverter Derating Based on Carrier Frequency

230V Models

1-20 HP

30 - 40 HP

25 HP

125-150 HP

215 HP

Note: The spec. please refer to Chapter 3.18, the rated current is 330/370A.

## 575/690V Models

575V 1-10 HP

575/690V 40-60 HP

575/690V 15-30 HP

575/690V 75HP

575/690V 100-150 HP

575/690V 175-270 HP

### 3.20 Inverter Derating Based on Temperature

## - Capacitor reforming Guide after long storage

For correct performance of this product after long storage before use it is important that Inverter Capacitors are reformed according to the guide below:

| Storage <br> time | Procedure to re-apply voltage |
| :---: | :--- |
| $\leqq 1$ year | Apply rated voltage(*1) of inverter in the normal way |
| Between <br> $1-2$ years | Apply rated voltage of inverter to the product for one hour |
|  | Use a variable AC power supply to <br> 1. Connecting 25\% of inverter rated voltage for 30 minutes. <br> $\geqq 2$ years <br> 2. Connecting 50\% of inverter rated voltage for 30 minutes. <br> 3. Connecting 75\% of inverter rated voltage for 30 minutes. <br> 4. Connecting 100\% of inverter rated voltage for 210 minutes. <br> Once the procedures completed, inverter just can be used normally. |

*1 : Rated voltage: please connects rated voltage according to model label of inverter.

### 3.21 Inverter Dimensions

(a) 230V: 1 - $7.5 \mathrm{HP} / 460 \mathrm{~V}: 1-7.5 \mathrm{HP} / 575 \mathrm{~V}: 1-3 \mathrm{HP}$ (IP20/NEMA1)

| Inverter Model | Dimensions in mm (inch) |  |  |  |  |  |  | Net Weight in kg (Ibs) |

## Chapter 4 Keypad and Programming Functions

### 4.1 LED Keypad

### 4.1.1 Keypad Display and Keys

(U Type)

(UE Type)

| DISPLAY | Description |
| :--- | :--- |
| $\mathbf{5}$ Digit LED Display | Monitor inverter signals, view / edit parameters, fault / alarm display. |
| LED INDICATORS | LED ON when a fault or alarm is active. |
| FAULT | LED ON when inverter is running in forward direction, flashing when stopping. |
| FWD | On when inverter is running in reverse direction, flashing when stopping. |
| REV | LED ON when RUN command is from the external control terminals or from serial <br> communication |
| SEQ | LED ON when Frequency Reference command is from the external control terminals <br> or from serial communication |
| REF |  |

| KEYS (8) | Description |
| :--- | :--- |
| RUN | RUN Inverter in Local Mode |
| STOP | STOP Inverter |
| $\mathbf{\Delta}$ | Parameter navigation Up, Increase parameter or reference value |
| $\mathbf{V}$ | Parameter navigation down, decrease parameter or reference value |
| FWD/REV <br> (U Type) | Used to switch between Forward and Reverse direction |
| LOC/REM <br> (UE Type) | Used to switch between Local Mode and Remote Mode <br> REMOTE Mode: Set by parameters, controlled by control circuit terminals, <br> communication or other ways. <br> LOCAL Mode: Controlled by operator. <br> It displays REMOTE Mode at power-up. Users can switch between LOCAL and <br> REMOTE Mode if they press LOC/ REM keys when the inverter stops. Parameter <br> of 23-41 can determine if LOC/REM keys are enabled or not. |
| DSP/FUN | Used to scroll to next screen <br> Frequency screen $\rightarrow$ Function selection $\rightarrow$ Monitor parameter |
| \& / RESET | Selects active seven segment digit for editing with the $\boldsymbol{\Delta} \boldsymbol{\nabla}$ keys <br> Used to reset fault condition. |
| READ / ENTER | Used to read and save the value of the active parameter |

## Auto-Repeat Keys

Holding the $\triangle$ UP or $\nabla$ DOWN key for a longer period of time will initiate the auto-repeat function resulting in the value of the selected digit to automatically increase or decrease.

### 4.1.2 Seven Segment Display Description

| Actual | LED Display | Actual | LED Display | Actual | LED Display | Actual | LED Display |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | $\begin{aligned} & 17 \\ & 11 \end{aligned}$ | A | $18$ | L | $1$ | Y | $1$ |
| 1 | $1$ | B | $1$ | n | 11 | - | - |
| 2 |  | C | $\begin{aligned} & 1 \\ & i \end{aligned}$ | 0 | $\begin{aligned} & 17 \\ & 18 \end{aligned}$ | - | $18$ |
| 3 | 7 | D | $1$ | P | E | - | - |
| 4 | 11 | E |  | 9 | $17$ |  | . |
| 5 | $E$ | F | 1 | r | 1 |  |  |
| 6 | $E$ | G | $\begin{aligned} & 1 \\ & 18 \end{aligned}$ | S | 1 |  |  |
| 7 | $1$ | H | 18 | t | 18 |  |  |
| 8 | 18 | 1 | 1 | u | 11 |  |  |
| 9 | $18$ | J | $1$ | V | $\begin{aligned} & 11 \\ & 11 \end{aligned}$ |  |  |

Display output frequency

Frequency Reference

Set Frequency Reference

- At power-up, the display will show the frequency reference setting and all LEDs are flashing. Press the $\Delta$ (UP) or $\boldsymbol{\nabla}$ (DOWN) key to enter the frequency reference edit mode, use the $\boldsymbol{4} /$ RESET key to select which digit to edit (flashing). Use the $\boldsymbol{\Delta}$ (UP) or $\boldsymbol{\nabla}$ (DOWN) key to modify the value and press the READ / ENTER key to save the frequency reference and switch back to the frequency reference display mode.
- During run operation, the display will show the output frequency.

Note: When in edit mode and the READ / ENTER is not pressed within 5 sec , the inverter will switch back to the frequency reference display mode.

| Seven Segment Display | Description |
| :--- | :--- | :--- |

### 4.1.3 LED Indicator Description

## - Fault LED

| State | Description | FAULT LED |
| :--- | :--- | :---: |
| Off | No Fault Active |  |
| Illuminated | Fault Active |  |

- Forward LED

| State | Description | FWD LED |
| :--- | :--- | :---: |
| Off | Inverter in reverse direction |  |
| Illuminated | Inverter is running in forward direction |  |
| Flashing | Forward direction active, no run command |  |

## - Reverse LED

| State | Description | REV LED |
| :--- | :--- | :---: |
| Off | Inverter in forward direction |  |
| Illuminated | Inverter is running in reverse direction |  |
| Flashing | Reverse direction active, no run command |  |

RUN LED

| State | Description | RUN LED |
| :--- | :--- | :---: |
| Off | Inverter stopped |  |
| Illuminated | Inverter running |  |
| Flashing | Inverter stopped or stopping |  |

- SEQ LED

| State | Description | SEQ LED |
| :--- | :--- | :---: |
| Off | Sequence controlled from keypad |  |
| Illuminated | Sequence set from external source |  |

- REF LED

| State | Description | REF LED |
| :--- | :--- | :---: |
| Off | Frequency reference set from keypad |  |
| Illuminated | Frequency reference set from external source |  |

Run / Stop Status Indicators

### 4.1.4 Power-up Monitor

- Power-up

- Changing Monitor at Power-up

| $\mathbf{1 2 - 0 0}$ |  | Display Selection |
| :---: | :--- | :--- |
| Range | Highest bit -> $\underline{\mathbf{0}} \underline{\mathbf{0}} \underline{\mathbf{0}} \underline{\mathbf{0}} \boldsymbol{<}$ <- Lowest bit |  |
|  | The setting range for each bit is $\mathbf{0} \sim \mathbf{7}$ from the highest bit to the lowest bit. |  |
|  | 0: No display | 4: Temperature |
|  | 1: Output current | 5: PID feedback |
|  | 2: Output voltage | 6: Al1 value |
|  | 3: DC voltage | 7: Al2 value |

## Example: 12-00=【10000】

### 4.1.5 Modifying Parameters/ Set Frequency Reference

Example: Modifying Parameters

## Example: Set Frequency Reference

Inverter stopped:

Set Frequency Reference 0.01 Hz

Set Frequency Reference 0.1 Hz

Set Frequency Reference completed.

Inverter is running:

Note: When upper or lower limit is reached during editing of the frequency reference, the edit value will automatically rollover from the lower limit to the upper limit or from the upper limit to the lower limit.

### 4.1.6 Operation Control

### 4.2 LCD Keypad

### 4.2.1 Keypad Display and Keys

(U Type)

(UE Type)

| DISPLAY | Description |
| :--- | :--- |
| LCD Display | Monitor inverter signals, view / edit parameters, fault / alarm display. |
| LED INDICATORS | LED ON when a fault or alarm is active. |
| FAULT | LED ON when inverter is running in forward direction, flashing when stopping. |
| FWD | On when inverter is running in reverse direction, flashing when stopping. |
| REV | LED ON when RUN command is from the external control terminals or from serial <br> communication |
| SEQ | LED ON when Frequency Reference command is from the external control terminals <br> or from serial communication |
| REF | l |

| KEYS (8) | Description |
| :--- | :--- |
| RUN | RUN Inverter in Local Mode |
| STOP | STOP Inverter |
| $\mathbf{\Delta}$ | Parameter navigation Up, Increase parameter or reference value |
| $\boldsymbol{\nabla}$ | Parameter navigation down, decrease parameter or reference value |
| FWD/REV <br> (U Type) | Used to switch between Forward and Reverse direction |
| LOC/REM <br> (UE Type) <br> REMOTE Mode: Set by parameters, controlled by control circuit terminals, <br> communication or other ways. <br> LOCAL Mode: Controlled by operator. <br> It displays REMOTE Mode at power-up. Users can switch between LOCAL and <br> REMOTE Mode if they press LOC/ REM keys when the inverter stops. Parameter <br> of 23-41 can determine if LOC/REM keys are enabled or not. |  |
| DSP/FUN | Used to scroll to next screen <br> Frequency screen $\rightarrow$ Function selection $\rightarrow$ Monitor parameter |
| 4 / RESET | Selects active seven segment digit for editing with the $\mathbf{\Delta}$ V keys <br> Used to reset fault condition. |
| READ / ENTER | Used to read and save the value of the active parameter |

## Auto-Repeat Keys

Holding the $\boldsymbol{\Delta U P}$ or $\boldsymbol{D}$ DOWN key for a longer period of time will initiate the auto-repeat function resulting in the value of the selected digit to automatically increase or decrease.

### 4.2.2 Keypad Menu Structure

## Main Menu

The A510 inverter main menu consists of two main groups (modes). The DSP/FUN key is used to switch between the monitor mode and the parameter group mode.

| Mode | Description |
| :--- | :--- |
| Monitor Mode | View inverter status, signals and fault data. |
| Parameter Group Mode | Access to available parameter groups. |

All the available parameter groups are listed in the Parameter Group Mode use the up and down keys to select a group and press Read/Enter key to access its parameters.

Fig. 4.2.2.1 Parameter Group Structure

## Notes:

- Always perform an auto-tune on the motor before operating the inverter in vector control (sensorless vector or flux vector). Auto-tuning mode will not be displayed when the inverter is running or when a fault is active.
- To scroll through the available modes, parameter groups or parameter list press and hold the up or down key.

## Monitor Mode

In monitor mode inverter signals can be monitored such as output frequency, output current and output voltage, etc...) as well as fault information and fault trace. See Fig 4.2.2.2 for keypad navigation.

Fig 4.2.2.2 Monitor Mode

## Note:

- To scroll through the available monitor parameter list, press and hold the $\boldsymbol{\triangle}$ (up) or $\boldsymbol{\nabla}$ (down) key.

## Programming Mode

In programming mode inverter parameters can be read or changed. See Fig 4.2.2.3 for keypad navigation.

Fig 4.2.2.3 Programming Mode

## Notes:

- The parameters values can be changed from the Edit screen with the up, down and </ RESET shift key.
- To save a parameter press the READ/ENTER key.
- Refer to section 4.4 for parameter details.
- Press the $\boldsymbol{\triangle}$ (up) or $\boldsymbol{\nabla}$ (down) key to scroll parameter groups or parameter list.

## Auto-tuning Mode

In the auto-tuning mode motor parameters can be calculated and set automatically based on the selected control mode. See Fig 4.2.2.4 for keypad navigation.

Fig 4.2.2.4 Auto-tuning Mode

## Notes:

- Set correct motor parameters by referring to motor nameplate.
- Refer to section 4.4 for parameter details.

### 4.2.2 Notes:

1. Use the up and down keys to scroll though the auto-tuning parameter list. Depending on the selected control mode in parameter 00-00, part of auto-tuning parameters will not be accessible. (Refer to the Auto-tuning Group 17 parameters).
2. After entering the motor nameplate rated output power (17-01), rated current (17-02), rated voltage (17-03), rated frequency (17-04), rated speed (17-05) and number of motor poles (17-06), select the automatic tuning mode and press the RUN key to perform the auto-tuning operation. When auto-tuning is successful the calculated motor parameters will be saved into parameter group 02 (motor parameter).
3. (a) "Rotational" will be displayed during rotational auto-tuning (17-00=0) and the motor will rotate during auto-tuning. Ensure that it is safe to operate the motor before pressing the RUN key.
(b) "Stationary" will be displayed during stationary auto-tuning ( $17-00=1$ ), the motor shaft does not rotate.
(c) "R1 Tuning" will be displayed during stationary auto-tuning (17-00=2), the motor shaft does not rotate.
(d) The RUN LED (in the upper left corner of the RUN key) will be lit during auto-tuning.
(e) The LCD display shows ">>>" or "Atund" during the auto-tuning process.
4. Press the STOP key on the keypad to abort the auto-tuning operation.
5. In case of an auto-tuning fault, a fault message and the uncompleted message are displayed on the keypad. The RUN LED will be flashing and the motor will coast to stop. (Refer to section 10.4 for the Auto-tuning Faults.) The auto-tuning fault can be cleared by pressing the RESET key after which the keypad displays the auto-tuning mode again.

All motor parameters (group 02 through group 17 parameters) will revert back to their factory settings if a fault occurs. The motor data must be entered again before re-starting auto-tuning. The keypad shows ">>>" during an auto-tuning fault.
6. Upon successful completion of an auto-tune, the RUN LED will turn off. Press the DSP/FUN key to return to the main menu to select the next operation. The auto-tuning procedure takes approximately 50 seconds.

### 4.3 Parameters

| Parameter group | Group Name |
| :--- | :--- |
| Group 00 | Basic Parameters |
| Group 01 | V/F Control Parameters |
| Group 02 | IM Motor Parameters |
| Group 03 | External Digital Input and Output Parameters |
| Group 04 | External Analog Input and Output Parameters |
| Group 05 | Multi-Speed Parameters |
| Group 06 | Automatic Program Operation Parameters |
| Group 07 | Start /Stop Parameters |
| Group 08 | Protection Parameters |
| Group 09 | Communication Parameters |

*: Refer to the following attachment 1.
**: Before to set up 00-32 Application, it should do initialized setting (parameter 13-08) first. When setting $00-32$, the I/O port function changed automatically. To avoid accident, be sure to confirm the I/O port signal of inverter and external terminal control.
*** If parameter 00-27 is set to ND mode, group 02 motor 1 parameter will automatically adjust to more than 1 class of it.
If parameter 00-27 is set to HD mode, group 02 motor 1 parameter will automatically adjust to the same class of it.
It is suggested that parameter 00-27 be set first before motor performs auto-tuning because the parameter will make the motor parameter automatically be changed.
***** If the maximum output frequency of motor is over 300 HZ , the frequency resolution is changed to 0.1 Hz .

KVA: The default value of this parameter will be changed by different capacities of inverter.
*: The default value is 1 in VF/ VF+PG mode while the default value is 0 in SLV/ SV/ SLV2 mode.
*: It is suggested that HD/ ND mode ( $00-27$ ) and application presets ( $00-32$ ) be selected first before motor performs auto-tuning.
Note: The value of mode selection of automatic tuning is 6 (Static Auto-tuning Combination). When do auto-tuning with no-load motor, it suggest select 17-00=5 (Rotation Auto-tuning Combination)
-1: It can be set when $17-00=1,2,6$.

## Low Voltage Detection Level Function:

Wiring:

Timing Diagram of Magnetic
Contactor
(1)
(2)
(3)

Before inputting emergency power, magnetic contactor (1)and (3) are ON and magnetic contactor (2) should be OFF. Magnetic contactor (3) should be ON after magnetic contactor is ON . Before removing battery and turning magnetic contactor (2) to be ON, Magnetic contactor (1)and (3) should be OFF.

Notes for the emergency power supply. Please be aware of the following condition when emergency power is ON:

1. Execute Low Voltage Function $\mathrm{ON}(\mathrm{DI}=62)$, Fan doesn't run.
2. Execute Low Voltage Function $\mathrm{ON}(\mathrm{Dl}=62)$, No phase loss.
3. Execute Low Voltage Function $\mathrm{ON}(\mathrm{Dl}=62)$, run frequency of motor depends on the value of07-31

Relevant parameters:
07-30 Low Voltage Level Selection set 0 (Enable)
$07-13$ Low Voltage Detection Level set to 250 V in 400 V Class.
03-00~03-07 Set EPS input (62) enable.
07-31 Set Low Voltage Run Frequency

### 4.4 Description of Parameters

| $\mathbf{0 0 - 0 0}$ | Control mode selection |
| :--- | :--- |
|  | 0: V/F |
|  | 1:V/F+PG |
|  | 2: SLV |
| Range | 3: SV |
|  | 4: PMSV |
|  | 5: PMSLV |
|  | 6: SLV2 |

The inverter offers the following control modes:

| Value | Mode | Info | Application |
| :---: | :---: | :--- | :--- |
| 0 | V/F | V/F Control without PG | General Purpose Applications which do <br> not require high precision speed control - <br> Auto-tuning is not required. |
| 1 | V/F+PG | V/F Control with PG <br> (speed compensation) | Closed loop speed control for General <br> purpose applications that require better <br> speed control than V/F mode without PG. |
| 2 | SLV | Sensorless Vector Control <br> without PG | General Purpose Applications that <br> require higher precision speed control <br> and torque response without the use of <br> an encoder. |
| 3 | SV | Closed Loop Vector Control with PG | General Purpose Applications that <br> require high precision speed control and <br> torque response with the use of an <br> encoder. |
| 4 | PMSV | PM Vector Control with PG <br> (Permanent Magnet Vector Control) | PM Motor Applications that require high <br> precision speed control and torque <br> response with the use of an encoder. |
| 5 | PMSLV | Sensorless Current Vector Control <br> without PG (for Permanent magnet <br> motor) | Without PG Applications. Provide the <br> requirements of high precision speed and <br> torque |
| 6 | SLV2 | Voltage vector control without PG | Without PG Applications. Vector control <br> provides high speed rotation and the <br> requirements of higher precision speed <br> than V/F and torque. |

## 00-00=0: V/F Mode

Select the required V/F curve (01-00) based on your motor and applications.
Perform a stationary auto-tune ( $17-00=2$ ), if the motor cable is longer than 50 m ( 165 ft ), see parameter $17-00$ for details.

## $00-00=1$ : V/F with PG

Select the required V/F curve (01-00) based on your motor and applications. Set number of motor poles (02-08) and encoder feedback pulses (20-27); refer to parameter group 20 for PF feedback setup. Perform a stationary auto-tune $(17-00=2)$ if the distance between the inverter and the motor more than 50 m ( 165 ft ), refer to parameter group 17 for details on auto-tuning.

## 00-00=2: Sensorless Vector Control

Verify the inverter rating matches the motor rating. Perform rotational auto-tune to measure and store motor parameters for higher performance operation. Perform non-rotational auto-tune if it's not possible to rotate the motor during auto-tune. Refer to parameter group 17 for details on auto-tuning.

## 00-00=3: Closed Loop Vector Control

Verify the inverter rating matches the motor rating. Perform rotational auto-tune to measure and store motor parameters for higher performance operation. Perform non-rotational auto-tune if it's not possible to rotate the motor during auto-tune. Refer to parameter group 17 for details on auto-tuning.

## 00-00=4: PM Vector Control

Verify the inverter rating matches the motor rating. Set PM motor data in parameters 22-00 to 22-06 and encoder feedback pulses in parameter 20-27. Refer to parameter 22-21 for details on PM Motor tuning.

Select the appropriate motor rating and braking resistor based on your motor and applications. Please install the braking module in the models of $230 \mathrm{~V} 30 \mathrm{HP} / 460 \mathrm{~V} 40 \mathrm{HP} / 575 \mathrm{~V} / 690 \mathrm{~V} 50 \mathrm{HP}$ or the above.

## 00-00=5: PM Sensorless Vector Control

Verify the inverter rating matches the motor rating. Perform rotational auto-tune to measure and store motor parameters for higher performance operation.

Perform auto-tuning before operation to enhance the performance of PMSLV mode. Refer to parameter 22-21 for the descriptions of PM motor tuning function.

Select the appropriate motor rating and braking resistor based on your motor and applications. Please install the braking module in the models of $230 \mathrm{~V} 30 \mathrm{HP} / 460 \mathrm{~V} 40 \mathrm{HP} / 575 \mathrm{~V} / 690 \mathrm{~V} 50 \mathrm{HP}$ or the above.

## 00-00=6: SLV2 Vector Control

Verify the inverter rating matches the motor rating. Perform rotational auto-tune to measure and store motor parameters for higher performance operation.

Refer to parameter group 17 for the descriptions of motor parameter tuning function.
Select the required V/F curve (01-00) based on your motor and applications.

Note: Parameter 00-00 is excluded from initialization.

| $\mathbf{0 0 - 0 1}$ | Motor's rotation direction |
| :---: | :--- |
| Range | 0: Forward <br> $1:$ Reverse |

Use the FWD/REV key to change motor direction when Run Command Selection (00-02 = 0) is set to keypad control. In keypad control operation the direction is stored in 00-01. Direction of this function will be limited to the motor direction lock selection of parameter 11-00.

| $\mathbf{0 0 - 0 2}$ | Run command selection |
| :--- | :--- |
| Range | 0: Keypad control |
|  | 1: External terminal control |
|  | 2: Communication control |
|  | 3: PLC |

## 00-02=0: Keypad Control

Use the keypad to start and stop the inverter and set direction with the forward / reverse key). Refer to section 4-1 for details on the keypad.

## 00-02=1: External terminal control

External terminals are used to start and stop the inverter and select motor direction.

| $\mathbf{0 0 - 0 3}$ | Alternative RUN Command Selection |
| :--- | :--- |
| Range | 0: Keypad control |
|  | 1: External terminal control |
|  | 2: Communication control |
| 3: PLC |  |

## 00-03=0: Keypad Control

Use the keypad to start and stop the inverter and set direction with the forward / reverse key). Refer to section 4-1 for details on the keypad.

## 00-03=1: External terminal control

External terminals are used to start and stop the inverter and select motor direction.

## *It is required to be with multi-function digital input (12: main and alternative run switch function),

The inverter can be operated in either 2-wire or 3 -wire mode.

## - 2-wire operation

For 2-wire operation, set 03-00 (S1 terminal selection) to 0 and 03-01 ( S 2 terminal selection) to 1 .

| Terminal S1 | Terminal S2 | Operation |
| :--- | :--- | :--- |
| Open | Open | Stop Inverter / FWD Active |
| Closed | Open | Run Forward |
| Open | Closed | Run Reverse |
| Closed | Closed | Stop Inverter, Display EF9 Alarm after 500ms |

Parameter 13 -08 to 2, 4 or 6 for 2-wire program initialization, multi-function input terminal S1 is set to forward , operation/ stop, and S2 is set for reverse, operation / stop.

Figure 4.4 .1 wiring example of 2-wire

## - 3-wire operation

For 3-wire operation set any of parameters 03-02 to 03-07 (terminal S3 ~ S8) to 26 to enable 3-wire operation in combination with S1 and S2 terminals set to run command and stop command.

Parameter 13 -08 to 3,5 or 7 for 3 -wire program initialization, multi-function input terminal S1 is set to run operation, S2 for stop operation and S7 for forward/reverse command.

Note: Terminal S1 must be closed for a minimum of 50 ms to activate operation.

Figure 4.4.2 wiring example of 3-wire

Figure 4.4.3 3-wire operation

## - 2-wire operation with hold function

To enable 2-wire operation with hold function, set any of parameters 03-02 to 03-07 (terminal S3 ~ S8) to 53. When this mode is enabled set terminal $\mathrm{S} 1(03-00=0)$ to forward and $\mathrm{S} 2(03-01=1)$ to reverse run command.

Note: Terminal S1, S2 and S5 must be closed for a minimum of 50 ms to activate operation.
Note: The inverter will display SE2 error when input terminals S1-S8 is set to 53 and 26 simultaneously.

00-02=2: Communication control
The inverter is controlled by the RS-485 port. Refer to parameter group 9 for communication setup.

## 00-02=3: PLC control

The inverter is controlled by the inverter built-in PLC logic. Refer to section 4.5.

| $\mathbf{0 0 - 0 4}$ | Language |
| :--- | :--- |
| Range | 0: English |
|  | 1: Simplified Chinese |
|  | 2: Traditional Chinese |
|  | 3: Turkish |

It is required to be with LCD keypad to display the language selection of parameter 00-04.
00-04=0, LCD keypad displays in English.
00-04=1, LCD keypad displays in Simplified Chinese.
00-04=2, LCD keypad displays in Traditional Chinese.
00-04=3, LCD keypad displays in Turkish.
Note: It will not restore to the default value when this parameter performs initialization.

| $\mathbf{0 0 - 0 5}$ | Main Frequency Command Source Selection |  |
| :--- | :--- | :--- |
| $\mathbf{0 0 - 0 6}$ | Alternative Frequency Source Selection |  |
|  | 0: Keypad |  |
|  | 1: External control (analog) |  |
|  | 2: Terminal UP / DOWN |  |
| Range | 3: Communication control |  |
|  | 4: Pulse input |  |
|  | 5: Reserved |  |
|  | 6: Reserved |  |
|  | 7: Al2 Auxiliary Frequency |  |
|  | 8: Manual Pulse Generator (MPG) |  |
|  |  |  |
|  |  |  |

## 00-05/00-06= 0: Keypad

Use the digital operator to enter frequency reference or to set parameter 05-01 (frequency reference 1) as alternative frequency reference source. Refer to section 4.1.4 for details.

## 00-05/00-06= 1: External control (Analog Input)

Use analog reference from analog input Al1 or Al2 to set the frequency reference (as shown in Figure 4.4.4).
Refer to parameters $04-00$ to select the signal type.

| Al1 - Analog Input 1 | Al2 - Analog Input 2 | 04-00 Setting <br> (Default = 1) | Dipswitch SW2 (U <br> Type) or SW4 (UE <br> Type) <br> (Default 'V') |
| :--- | :--- | :--- | :--- |
| $0 \sim 10 \mathrm{~V}$ | $0 \sim 10 \mathrm{~V}$ | 0 | Set to ' $V$ ' |
| $0 \sim 10 \mathrm{~V}$ | $4 \sim 20 \mathrm{~mA}$ | 1 | Set to 'l' |
| $-10 \sim 10 \mathrm{~V}$ | $0 \sim 10 \mathrm{~V}$ | 2 | Set to ' $V$ ' |
| $-10 \sim 10 \mathrm{~V}$ | $4 \sim 20 \mathrm{~mA}$ | 3 | Set to 'I' |
| $4 \sim 20 \mathrm{~mA}$ | 4 | Set to 'V' |  |
| $4 \sim 20 \mathrm{~mA}$ | $5 \sim 10 \mathrm{~V}$ | Set to ' 'l' |  |

Note: Set parameter 04-05 to 10 to add frequency reference using AI2 to AI1.

Figure 4.4.4 Analog input as main frequency reference command (For U type)

## 00-05/00-06= 2: Terminal UP / DOWN

The inverter accelerates with the UP command closed and decelerates with the DOWN command closed. Please refer to parameter 03-00 ~ 03-07 for additional information.

Note: To use this function both the UP and DOWN command have to be selected to any of the input terminals.

## 00-05/00-06=3: Communication control

The frequency reference command is set via the RS-485 communication port using the MODBUS RTU protocol.
Refer to parameter group 9 for additional information.

## 00-05/00-06= 4: Pulse input

To use this function a pulse train input is required to be connected to the PI input and GND (see fig. 4.4.5).
Set parameter 03-30 to 0 to use the pulse input as frequency reference. Refer to parameters $03-31$ to $03-34$ for pulse input scaling.

PI input terminal, built-in resistance, is not required to connect the resistance if open collector input mode is used.

Serial pulse input
(Internal resistence : 3.89 K)

## Specification

Low Input Level: 0.0 to 0.5 V
High Input Level: 4.0 to 13.5 V
Duty cycle: (ON / OFF) 30 \% to 70\%
Pulse Input frequency range: 50 to 32 KHz

Figure 4.4.5 Frequency reference from pulse input

## 00-05/00-06= 7: Al2 Auxiliary Frequency

When $04-05$ is set to 0 (auxiliary frequency), frequency command is provided by multi-function analog input Al2 and the maximum output frequency ( $01-02$, Fmax) $=100 \%$.

When 04-05 is not set to 0 , the frequency is 0 . Refer to the parameters of $03-00 \sim 03-07$ for multi-speed descriptions.

## 00-05= 8: Manual Pulse Generator (MPG)

Frequency command depends on the manual pulse generator (MPG). The speed of MPG is multiplied by the speed magnification calculation (parameter 20-43) and limited by the speed command limit (parameter 20-44). The MPG command is required to be installed the induction motor PG card (JN5-PG-L or JN5-PG-O).

| $\mathbf{0 0 - 0 7}$ | Main and Alternative Frequency Command modes |
| :---: | :--- |
| Range | 0: Main frequency <br> 1: Main frequency + alternative frequency |

When $00-07$ is set to 0 , the reference frequency is set by the main reference frequency selection of parameter $00-05$. When $00-07$ is set to 1 the reference frequency is sum of the main reference frequency ( $00-05$ ) and alternative frequency (00-06).

Note: The inverter will display the SE1 error when 00-07 = 1 and parameter 00-05 and 00-06 are set to the same selection.

When parameter $00-06$ is set to 0 (Keypad) the alternative frequency reference is set by parameter 05-01 (Frequency setting of speed-stage 0 ).

| $\mathbf{0 0 - 0 8}$ | Communication frequency command - READ ONLY |
| :--- | :--- |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |

Display the frequency reference when 00-05 or 00-06 is set to communication control (3).

| $\mathbf{0 0 - 0 9}$ | Communication frequency command memory |
| :---: | :--- |
| Range | 0: Don't save when power supply is off. (00-08) <br> 1: Save when power is off. (00-08) |

Note: This parameter is only enabled in communication mode.

| $\mathbf{0 0 - 1 0}$ | Minimum frequency detection |
| :---: | :--- |
| Range | 0:Show warning if lower than minimum frequency <br> 1:Run as minimum frequency if lower than minimum frequency |

$00-10=0$ : Frequency command is lower than 01-08 (Minimum Output Frequency of Motor 1), it shows STP0 warning.
$00-10=1$ : Frequency command is lower than 01-08 (Minimum Output Frequency of Motor 1), inverter run as Minimum Output Frequency of Motor 1.

| $\mathbf{0 0 - 1 1}$ | Selection of PID Lower Limit Frequency |
| :---: | :--- |
| Range | 【0】 $: ~ P I D ~ i s ~ b o u n d ~ t o ~ l o w e r ~ l i m i t ~ f r e q u e n c y ~ w h e n ~ i n v e r t e r ~ s l e e p s . ~$ |

When inverter gets to sleep,
$\mathbf{0 0 - 1 1 = 0}$ : PID is bound to lower limit frequency (00-13).
$00-11=1$ : PID is bound to 0 Hz .

Note: Refer to descriptions of parameters 10-17~10-20 for details when inverter gets to sleep.

| $\mathbf{0 0 - 1 2}$ | Upper Limit Frequency |
| :---: | :--- |
| Range | $0.1 \sim 109.0 \%$ |

Set the maximum frequency reference as a percentage of the maximum output frequency. Maximum output frequency depends on motor selection.
Motor 1: Maximum frequency parameter 01-02.
Motor 2: Maximum frequency parameter 01-16.

| $\mathbf{0 0 - 1 3}$ | Lower Limit Frequency |
| :---: | :--- |
| Range | $0.0 \sim 109.0 \%$ |

Set the minimum frequency reference as a percentage of the maximum output frequency. Maximum output frequency depends on motor selection. Motor 1: Maximum frequency is set by parameter 01-02 and Motor 2 Maximum frequency is set by parameter 01-16.

- When the frequency lower limit is set to a value greater than 0 and the inverter is started the output frequency will accelerate to the frequency lower limit with a minimum frequency defined by parameter 01-08 for motor 1 and parameter 01-22 for motor 2.
- Frequency upper limit has to greater or equal to the frequency lower limit otherwise the inverter will display a SE01 (Set range error).
- Frequency upper and lower limit is active for all frequency reference modes.

Figure 4.4.6 Frequency reference upper and lower limits
Note: The maximum frequency setting in the keypad is according to parameter 01-02 (Maximum Output Frequency) and 00-12 (Upper Frequency limit). The upper frequency limit is not over than 599 Hz and Al frequency is $100 \%$ to parameter 01-02.

| $\mathbf{0 0 - 1 4}$ | Acceleration time 1 |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 1 5}$ | Deceleration time 1 |
| :--- | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 1 6}$ | Acceleration time 2 |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 1 7}$ | Deceleration time 2 |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 2 1}$ | Acceleration time 3 |
| :--- | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 2 2}$ | Deceleration time 3 |
| :--- | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 2 3}$ | Acceleration time 4 |
| :--- | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 2 4}$ | Deceleration time 4 |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 2 5}$ | Switch-Over Frequency of Acceleration and Deceleration Time $\mathbf{1}$ and Time $\mathbf{4}$ |
| :---: | :--- |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |

Acceleration time is the time required to accelerate from 0 to $100 \%$ of maximum output frequency. Deceleration time is the time required to decelerate from 100 to $0 \%$ of maximum output frequency.
Motor 1: Maximum frequency is set by parameter 01-02 and Motor 2 Maximum frequency is set by parameter 01-16.

Note: Actual acceleration and deceleration times can be affected by the inverter driven load.
The default values for the acceleration, deceleration times are dependent on the inverter size.

| Size |  | Acceleration / Deceleration <br> Default Value |
| :---: | :---: | :---: |
| 230V series | 460V series | 10s <br> $1 \sim 10 \mathrm{HP}$ $1 \sim 15 \mathrm{HP}$ |

| 575 V series | $1 \sim 3 \mathrm{HP}$ | 10 s |
| :---: | :---: | :---: |
|  | $5 \sim 10 \mathrm{HP}$ | 20 s |
| 690 V series | $15 \sim 40 \mathrm{HP}$ | 25 s |
|  | $50 \sim 535 \mathrm{HP}$ | 30 s |

## A: Select acceleration and deceleration time via the digital input terminals

The following table shows the acceleration / deceleration selected when the digital input function Accel/ Decel time 1 (\#10) and Accel/Decel time 2 1(\#30) are used.

Table 4.4.1 acceleration / deceleration time selection

| Accel/decel time 2 <br> (Set 03-00 ~ 03-07 = 30) | Accel/decel time 1 <br> (Set 03-00 to 03-07 = 10) | Acceleration <br> time | Deceleration <br> time |
| :---: | :---: | :---: | :---: |
| 0 | 0 | Taccc1 $(00-14)$ | Tdec1 $(00-15)$ |
| 0 | 1 | Taccc2 $(00-16)$ | Tdec2 $(00-17)$ |
| 1 | 0 | Taccc3 $(00-21)$ | Tdec3 $(00-22)$ |
| 1 | 1 | Taccc4 $(00-23)$ | Tdec4 $(00-24)$ |

0: OFF, 1: ON

Figure 4.4.7: Terminal S5 switch between Tacc1/Tacc2 and Tdec1/Tdec2

## B. Switch of Acceleration/Deceleration time according to motors

$03-00 \sim 03-07$ set to 40 (Switching between motor $1 /$ motor 2), it can switch motors by digital input. This function I only for V/F control mode and V/F +PG card mode.

Chose for motor1, acceleration and deceleration time of multi-speed depends on Figure 4.4.1. Chose for motor, acceleration and deceleration time of multi-speed depends on the following Figure.

| Chose motor2 |  |  |
| :---: | :---: | :---: |
| acceleration and <br> deceleration time $\mathbf{1}$ <br> (Set 03-00 to 03-07 = 10) | acceleration | deceleration |
| 0 | Taccc3(00-21) | Tdec3(00-22) |
| 1 | Taccc4(00-23) | Tdec4(00-24) |

## C. Automatically switch acceleration/deceleration time

When output frequency equals to the value of $00-25$, it follows the value of $00-25$ to automatically switch acceleration/ deceleration time1 and time2.Please refer to the following Figure4.4.8.

Figure 4.4.8 automatically switch Acceleration/Deceleration time

- When output frequency Fout $<00-25$ : Acceleration/deceleration time = Acceleration time1/ deceleration time 1(00-14 and 00-15).
- When output frequency Fout $\geqq 00-25$ : Acceleration/deceleration time $=$ Acceleration time $4 /$ deceleration time 4(00-23 and 00-24)
When 03-00~03-07 set to 10 (Acceleration/ Deceleration Time Selection 1) and 03-00~03-07 set to 3 (Acceleration/ Deceleration Time Selection 2), the priority is higher than 00-25.

| $\mathbf{0 0 - 1 8}$ | Jog frequency |
| :--- | :--- |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |

| $\mathbf{0 0 - 1 9}$ | Jog acceleration time |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 0 - 2 0}$ | Jog deceleration time |
| :---: | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

Jog acceleration time (00-19) is the time required to accelerate from 0 to $100 \%$ of maximum output frequency. Jog deceleration time (00-20) is the time required to decelerate from 100 to $0 \%$ of maximum output frequency. Motor 1: Maximum frequency is set by parameter 01-02 and Motor 2 Maximum frequency is set by parameter 01-16.

When run command selection is external terminal control ( $00-02=1$ ) and the inverter uses the jog frequency ( $00-18$, default 6.0 Hz ) as its frequency reference with $03-00 \sim 03-07=6$ or $7(6$ : Forward jog run command 7 : Reverse jog run command). The motor will run by the setting.

| $\mathbf{0 0 - 2 6}$ | Emergency stop time |
| :---: | :--- |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |

The emergency stop time is used in combination with multi-function digital input function \#14 (Emergency stop). When emergency stop input is activated the inverter will decelerate to a stop using the Emergency stop time (00-26) and display the [EM STOP] condition on the keypad.

Note: To cancel the emergency stop condition the run command has to be removed and emergency stop input deactivated.

Figure 4.4.9 Emergency stop example

Multi-function digital input terminals (03-00~03-07) are set to 14: When the emergency stop input is activated the inverter will decelerate to a stop using the time set in parameter 00-26.

Note: After an emergency stop command the run command and emergency stop command have to be removed before the inverter can be restarted. Please refer to Figure 4.4.9. The emergency stop function can be used to stop inverter in case of an external event.

Multi-function digital input terminals (03-00~03-07) set to 15: When the base block input is activated the inverter output will turn off and the motor will coast to a stop.

| $\mathbf{0 0 - 2 7}$ | HD/ND selection |
| :---: | :--- |
| Range | 0: HD (Heavy Duty / Constant Torque) <br> $1:$ ND (Normal Duty / Variable Torque) |

The inverter overload curve, carrier frequency, stalls prevention level, rated input/output current and maximum frequency are automatically set based on the inverter duty (HD/ND) selection.

Please refer to table 4.4.2 for detailed information.
Table 4.4.2 Heavy Duty (Constant torque) / Normal Duty (Variable torque)

| $\mathbf{0 0 - 2 7}$ | Overload <br> capacity | Carrier frequency | Maximum <br> output <br> frequency | Stall <br> prevention <br> level | Rated input / <br> output current |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 <br> (Heavy Duty) | $150 \%, 1$ min | $2-16 \mathrm{KHz}$ <br> (KVA dependent) | 599.00 Hz | $150 \%$ <br> $(08-00,08-01)$ | Refer to section <br> 3.7 |
| 1 <br> (Normal Duty) | $120 \%, 1$ min | $2-16 \mathrm{KHz}$ <br> (KVA dependent) | 120.00 Hz | $120 \%$ <br> $(08-00,08-01)$ |  |

## 00-27= 0: Heavy Duty Mode

Select V/F curve (Group 1) and enter motor data (Group 2) to match the application. In Heavy Duty mode the maximum output frequency is 599 Hz for all control modes, except for SLV mode (Sensorless Vector / Open Loop Vector Mode) where the maximum output frequency is limited based on the inverter rating, see table below.

| Horsepower | Special circumstances | Maximum output frequency |
| :---: | :---: | :---: |
| 230V 1~10HP, 440V 1~15HP | - | 150 Hz |
| 230V 15~25HP, 440V 20HP | - | 110 Hz |
| 460 V 25~30HP | - | 100 Hz |
| 230V 30~150HP, 460V 40~425HP, | Carrier frequency (11-01) set 8 KHz or below | 100 Hz |
| 230V 30~100HP, 460V 40~175HP, | Carrier frequency (11-01) set 8 KHz or higher | 80 Hz |
| 575 V 1~10HP | - | 150 Hz |
| 575V/690V 15~40HP |  | 110 Hz |
| 575V/690V 50~535HP | Carrier frequency (11-01) set 8 KHz or below | 100 Hz |
| 575V/690V 50~535HP | Carrier frequency (11-01) set 8 KHz or below | 80 Hz |

## 00-27=1: Normal Duty Mode

In normal duty mode only applies to control modes V/F and V/F + PG. All other modes must use the Heavy Duty settings.

| Range | $0:$ Positive characteristic $(0-10 \mathrm{~V} / 4-20 \mathrm{~mA}=0-100 \%)$ <br> $1:$ Negative / inverse characteristic $(0-10 \mathrm{~V} / 4 \sim 20 \mathrm{~mA}=100-0 \%)$ |
| :---: | :--- |

$00-28=0$ : Positive reference curve, $0-10 \mathrm{~V} / 4-20 \mathrm{~mA}=0-100 \%$ main frequency reference.
$\mathbf{0 0 - 2 8 = 1}$ : Negative reference curve, $0-10 \mathrm{~V} / 4-20 \mathrm{~mA}=100-0 \%$ main frequency reference.
Note 1: Selection applies to analog input Al1 and AI2.
Note 2: Al2 will be useful for analog input frequency command when 04-05=0.

(a) Normal / Positive Characteristics

(b) Inverse / Negative Characteristics

Figure 4.4.10 Positive/negative analog input as main frequency reference command.

| $\mathbf{0 0 - 2 9}$ | Zero-speed operation selection |
| :--- | :--- |
| Range | 0: Operation based on frequency command |
|  | 1: Stop |
|  | 2: Operation based on lowest frequency |
| 3: Zero-speed operation |  |

Refer to figure 4.4.11 for zero-speed operation in sensor vector mode (SV / PMSV) (00-00=3 or 00-00=4).

Figure 4.4.11 Zero-speed operation of sensor vector (SV) and PM vector (PMSV) mode
$D C$ injection braking activates when the run command is removed and output frequency falls below the DC injection braking start frequency (07-06). DC injection braking will be active for the time set in parameter 07-08 DC injection braking execution time. Refer to figure 4.4.62 for more information on the pre-excitation operation.

| $20-44$ | MPG Speed Command Limit | 6.0 Hz |

| $\mathbf{0 0 - 3 3}$ | Modified Parameters |
| :---: | :--- |
| Range | 0: Disable <br> 1: Enable |

Note: Only for LCD keypad.
This parameter automatically lists all the adjusted parameters. When the default value is adjusted and $00-33=1$, it will list all the parameters different from default values in the advanced modes and these parameters can be edited directly. The adjusted parameters list displays only when $00-33$ is set from 0 to 1 or $00-33=1$ at start up.

If user wants to restore to the original editing interface, it is only required to set parameter 00-33=0.
This function can display 250 adjusted parameters. If they are more than 250 parameters, it will list the adjusted parameters before 250 .

Example: Set 00-03 (alternative run command source selection) to be different from the default value.

| Steps | LCD Display | Descriptions |
| :---: | :--- | :--- |
| 1 | Group |  |
|  | 00 Basic Func. | 01 V/F Pattern |
|  | 02 Motor Parameter | The starting parameter group (00) in the setting modes of $\boldsymbol{\Delta}($ Up)/ |
|  |  |  |
|  |  |  |

| 2 | PARA <br> 00 <br> -01. Motor Direction <br> -02. RUN Source <br> -03. Sub RUN Source | Press READ/ ENTER key and $\boldsymbol{\Delta}(\mathrm{Up}) / \mathbf{\nabla}$ (Down) to select alternative run command source ( $00-03$ ). |
| :---: | :---: | :---: |
| 3 | Edit $\quad$ Sub RUN Sou ce ${ }^{00-00}$ <br> $1 \underset{ }{1}(0 \sim 4)$ <br> $<2>$ | Press READ/ ENTER key and adjust the value. The selected setting value will flash. |
| 4 | PARA $00$ <br> -33. Modify parameter <br> -41. User P1 <br> -42. User P2 | Press DSP/ FUN to the menu of modified parameters (00-33). |
| 5 |  | Press READ/ ENTER key to adjust the value to 1 (The modified parameter is enabled.) The selected setting value will flash. |
| 6 | Modify 00 <br> $00-03$. Sub RUN Source <br> $00-33$. Modify parameter | Press DSP/ FUN back to the advanced modes. |

User parameter setting (00-41 to 00-56) (only for LCD keypad)

| $00-41$ | User parameter 0 |
| :---: | :--- |
| $00-42$ | User parameter 1 |
| $00-43$ | User parameter 2 |
| $00-44$ | User parameter 3 |
| $00-45$ | User parameter 4 |
| $00-46$ | User parameter 5 |
| $00-47$ | User parameter 6 |
| $00-48$ | User parameter 7 |
| $00-48$ | User parameter 8 |
| $00-50$ | User parameter 9 |
| $00-51$ | User parameter 10 |
| $00-52$ | User parameter 11 |
| $00-53$ | User parameter 12 |
| $00-54$ | User parameter 13 |
| $00-55$ | User parameter 14 |
| $00-56$ | User parameter 15 |

- User parameter (00-41 ~00-56) can select 16 sets of parameters (group $00 \sim 22$, but except 00-00/ $00-41 \sim 00-56$ / group 17) and put them into the list to do the fast access setting.
- When the access setting of parameter 13-06 is set to 1 , user parameter 00-41~00-56 can be displayed and changed.
- User parameter 00-41 ~00-56 can be changed in the advanced modes, exclusive of being in operation.
- Set value in the parameter of 00-41 $\sim 00-56$ and set 13-06 to 1 .
- When $13-06=1$, only parameter of $00-00 \sim 00-56$ can be set or read in the advanced modes. $13-06=1$ is enabled in the parameter setting of 00-41~00-56.
- When user would like to leave the screen of user parameters, press RESET key and then DSP/FUN key to select parameter Group 13.

## Example 1: Set 03-00 (Multi-function terminal Function Setting-S1) to user parameter 0 (00-41)

| Steps | LCD Display | Descriptions |
| :---: | :---: | :---: |
| 1 | Group <br> 00 Basic Func. <br> 01 V/F Pattern <br> 02 Motor Parameter | Select the start parameter group (00) in the advanced modes. |
| 2 | PARA 00 <br> -41. User P0 <br> -42. User P1 <br> -43. User P2 | Press (READ/ ENTER) key and $\boldsymbol{\Delta}$ (Up) / $\boldsymbol{\nabla}$ (Down) to select user parameter 0 (00-41). |
| 3 | Edit User P0=00-41 ${ }^{00-41}$ | Press (READ/ ENTER) key to the screen of data setting/ read. <br> * The selected setting value will flash. |
|  | $\begin{aligned} & \hline 00-41 \quad \text { User Po } \\ & <00-01-24-07> \end{aligned}$ |  |
| 4 | Edit User P0=00-41 ${ }^{00-41}$ | Press 4 (Left) / (Right) and $\boldsymbol{\Delta}$ (Up) / $\boldsymbol{\nabla}$ (Down) key to set the value to 03-00 ( Multi-function terminal Function Setting-S1) |
|  | $\begin{aligned} & \begin{array}{l} \text { 03-00 } \\ <00-01 \\ \text { S1 Function Sel } \\ 24-07> \end{array} \end{aligned}$ |  |
| 5 | Edit User P0 = 03- $0^{00-41}$ | Press (READ/ ENTER) key to save 03-00 and the digit stops flashing <br> and the screen displays User P0 = 03-00; 03-00 <br> (Multi-function terminal Function Setting-S1) has been defined as $00-41$. Few seconds later, the selected digit will flash again. |
|  | $\begin{aligned} & 03-00 \quad \text { S1 Function Sel } \\ & \text { <00-01-24-07> } \end{aligned}$ |  |
| 6 | Monitor | Press (DSP/ FUN) key to the display of main screen. <br> * If users do not press BACK key in one minute, the screen will automatically display the monitor mode shown as the left figure. The automatically return time can be set via 16-06. |
|  | Freq Ref |  |
|  |  |  |
|  | $\frac{12-17=000.00 \mathrm{~Hz}}{12-18=0000.0 \mathrm{~A}}$ |  |

Example 2: After one or more parameters in 00-41 ~ 00-56 are set, user parameters settings are as follows.

| Step | LCD Display | Descriptions |
| :--- | :--- | :--- |
| 1 | Group <br> 13 Driver Status <br> 14 PLC Setting <br> $15 ~ P L C ~ M o n i t o r ~$ | Select the start parameter group (03) in the advanced modes. |

| Step | LCD Display | Descriptions |
| :---: | :---: | :---: |
| 10 | Edit ${ }^{00-41}$ <br> S1 Function Sel  <br> 00 2-Wire <br> $(00 \sim 57)$ (FWD-RUN) <br> $<00>$ $<03-00>$ | Press (READ/ ENTER) key to enter the screen of data setting/ read. *The selected setting value will flash. <br> In this example, 03-00 (Multi-function terminal Function Setting-S1) has been defined as user parameters (00-41). The right bottom location displays the original parameter group. |
| 11 | Edit ${ }^{00-41}$ <br> S1 Function Sel  <br> 06 FJOG <br> $(00 \sim 57)$  <br> $<00>$ $<03-00>$ | Press $\boldsymbol{\Delta}$ (Up) / V (Down) key to change the setting value to 2 . Use (READ/ ENTER) key to save the setting value. <br> When the selected setting value does not flash again, the setting value will be saved to 00-41 and 03-00 simultaneously. |
| 12 | Monitor Freq Ref <br> $12-16=000.00 \mathrm{~Hz}$ <br> $---------------------------------17=000.0 \mathrm{~Hz}$ <br> $12-18=0000.0 \mathrm{~A}$ | Press (DSP/FUN) key to the display of main screen. <br> * If users do not press (DSP/ FUN) key in one minute, the screen will automatically display the monitor mode shown as the left figure. The automatically return time can be set via 16-06. |

## User Parameter Run Mode Structures

A. Define Parameter Group 0~24 as user parameters except parameter 00-00 and 00-41~00-56.
[ Main Screen ] [ Main Menu] [ Subdirectory] READ/ ENTER ]

Note: User level (13-06=1) can be set by one or more parameters in the user parameters of 00-41~00-56.

| $\mathbf{0 0 - 5 7}$ | SV High Speed Mode |
| :---: | :--- |
| Range | 0: SV High Speed Mode 1 <br> 1: SV High Speed Mode 2 |

When the inverter runs in SV mode, SV high speed mode 2 is selected if it is required to use urgent accel./ decel.

| 01-00 | V/F curve selection |
| :---: | :--- |
| Range | $0 \sim$ FF |

The V/F curve selection is enabled for V/F mode with or without PG or SLV2 mode. Make sure to set the inverter input voltage parameter 01-14.

There are three ways to set V/F curve:
(1) $01-00=0$ to E : choose any of the 15 predefined curves ( 0 to E ).
(2) 01-00 $=0 \mathrm{~F}$, use 01-02~01-09 and 01-12~01-13, with voltage limit.
(3) 01-00 = FF: use 01-02~01-09 and 01-12~01-13, without voltage limit. Refer to the following figure.

The default parameters (01-02~01-09) are the same when 01-00 is set to $F$ (default) and 01-00 is set to 1 .
Parameters 01-02 to 01-13 are automatically set when any of the predefined V/F curves are selected.
Note: This parameter is not affected by the initialization parameter (13-08).
Consider the following items as the conditions for selecting a V/F pattern.
(1) The voltage and frequency characteristic of motor.
(2) The maximum speed of motor.

## V/F curve setting (01-02~01-09 and 01-12~01-13)

Select any of the predefined V/F curves setting ' 0 ' to ' $E$ ' that best matches your application and the load characteristic of your motor, choose a custom curve setting ' $F$ ' or ' $F F$ ' to set a custom curve.

Important:
Improper V/F curve selection can result in low motor torque or increased current due to excitation.
For low torque or high speed applications, the motor may overheat. Make sure to provide adequate cooling when operating the motor under these conditions for a longer period of time.

If the automatic torque boost function is enabled (parameter 01-10), the applied motor voltage will automatically change to provide adequate motor torque during start or operating at low frequency.

## Custom V/F Curve Setting:

A custom curve selection allows users to set parameters 01-02 ~ 01-13 whereas a predefined curve selection does not.

Figure 4.4.12 Custom V/F curve

Figure 4.4.13 Torque boosting
When setting the frequency related parameters for a custom V/F curve values make sure that:
$\underset{(01-02)}{\mathrm{F}_{\text {max }}} \geq \underset{(01-12)}{\mathrm{F}_{\text {base }}}>\underset{(01-04)}{\mathrm{F}_{\text {mid2 }}}>\underset{(01-06)}{\mathrm{F}_{\text {mid1 }}}>\mathrm{F}_{(01 \mathrm{~min}}$

The 'SE03' V/F curve tuning error is displayed when the frequency values are set incorrectly.
When 01-04 and 01-05 (or 01-18 and 01-19) are set to 0 , the inverter ignores the set values of Fmid2 and Vmid2.
The voltage values for 01-02~01-09 are irrelevant.
The value for maximum output voltage of motor 1(01-03) and the value for base output voltage of motor 1(01-13) will depend on restore factory setting(13-08) to set the value of voltage.

When the control mode is changed parameter 00-00, 01-08 ( $\mathrm{F}_{\text {min }}$ ) and 01-09 ( $\mathrm{V}_{\text {min }}$ ) will automatically be changed to the default setting of the selected control mode.

## SLV or SV Mode (Sensorless Vector or Sensor Vector Control)

Enter the motor data in parameter group 17 for SV and SLV control mode ( $00-00$ ) and perform auto-tuning.
In the SV and SLV mode the V/F curve normally does not have to be re-adjusted after a successful auto-tune.
The maximum output frequency setting 01-02 (Fmax), base frequency 01-12 (Fbase), minimum output frequency 01-08 (Fmin), maximum output voltage 01-03 (Vmax) or base output voltage 01-13 (Vbase) can be adjusted but the voltage is automatically adjusted by the internal current controller.

Set the base frequency (01-12, Fbase) to the motor rated frequency on the motor nameplate.
Perform the auto-tuning procedure after adjusting parameters $02-19$ or 17-04 to reduce the voltage at no-load operation.

Motor jitter can be reduced by lowering the no-load voltage. Please note that lowering the no-load voltage increases the current at no-load.

## * The setting of V/F curve in SLV2 is the same as that in VF mode.

| $\mathbf{0 1 - 1 0}$ | Torque compensation gain |
| :---: | :--- |
| Range | $0.0 \sim 2.0$ |

In V/F or V/F + PG and SLV2 mode the inverter automatically adjusts the output voltage to adjust the output torque during start or during load changes based on the calculated loss of motor voltage.

Torque compensation gain (01-10) can adjust in the running time. No need to adjust in general except the following:

- If the wire between inverter and motor is too long, add the value of 01-10
- If the capacity of motor is smaller than inverter, add the value of 01-10.
- If the motor vibrates, reduce the value of 01-10

Refer to the torque compensation gain adjustment shown in Figure 4.4.14.

Figure 4.4.14 Torque compensation gain to increase/decrease output torque

Increase value when:

- The wiring between the inverter and the motor very too long
- The motor size is smaller than the inverter size

Note: Gradually increase the torque compensation value and make sure the output current does not exceed inverter rated current.

Reduce value when:

- When experiencing motor vibration

## Important:

Confirm that the output current at low speed does not exceed the rated output current of the inverter.

| $\mathbf{0 1 - 1 1}$ | Selection of Torque Compensation Mode |
| :---: | :--- |
| Range | $0:$ Torque Compensation Mode 0 <br> 1: Torque Compensation Mode 1 |

Torque compensation mode 0 is the general mode.
Torque Compensation Mode 1 is the high speed mode ( $120 \sim 160 \mathrm{~Hz}$ ) and the compensation amount decreases as the increasing frequency. When the speed is at $0 \sim 120 \mathrm{~Hz}$, the compensation amount is the same as that in

Torque compensation mode 0.

| $\mathbf{0 1 - 1 4}$ | Input voltage setting |
| :---: | :--- |
| Range | 200V: $155.0 \sim 255.0 \mathrm{~V}$ |
|  | $400 \mathrm{~V}: 310.0 \sim 510.0 \mathrm{~V}$ |
|  | $575 \mathrm{~V}: 540.0 \sim 670.0 \mathrm{~V}$ |
|  | $690 \mathrm{~V}: 648.0 \sim 804.0 \mathrm{~V}$ |

The minimum input voltage of inverter is 0.1 V .

Set the inverter input voltage (E.g. 200V / 208V / $230 \mathrm{~V} / 240 \mathrm{~V}$ or $380 \mathrm{~V} / 415 \mathrm{~V} / 440 \mathrm{~V} / 460 \mathrm{~V} / 480 \mathrm{~V}$ ).

This parameter is used as a reference for predefined V/F curve calculation (01-00 = 0 to E), over-voltage protection level, stall prevention, etc...

Note: It will depend on restore factory setting (13-08) to set the value of voltage

| $01-15$ | Torque compensation time |
| :---: | :--- |
| Range | $0 \sim 10000 \mathrm{~ms}$ |

Set the torque compensation delay time in milliseconds.
Only adjust in the following situations:

Increase value when:

- When experiencing motor vibration

Decrease value when:

- When motor torque response is too slow

| 01-16 | Maximum output frequency of motor 2 |
| :--- | :--- |
| Range | $4.8 \sim 599.0 \mathrm{~Hz}$ |

|  | $690 \mathrm{~V}: 0.0 \sim 804.0 \mathrm{~V}$ |

| $01-26$ | V/F Curve Selection of Motor 2 |
| :--- | :--- |
| Range | $0 \sim$ FF |

Note: Motor $2 \mathrm{~V} / \mathrm{F}$ curve uses the same settings as motor 1 .
Note: Motor 2 V/F curve is the same as Motor 1, please refer to Table 4.4.3~26

| 02-00 | No-load current of motor 1 |
| :---: | :---: |
| Range | 0.01~600.00 A |
| 02-01 | Rated current of motor 1 |
| Range | V/F and V/F+PG modes are 10\%~200\% of inverter's rated current. SLV, SV modes are $25 \% \sim 200 \%$ of inverter's rated current. |
| 02-03 | Rated rotation speed of motor1 |
| Range | 0~60000 rpm |
| 02-04 | Rated voltage of motor1 |
| Range | $\begin{aligned} & 200 \mathrm{~V}: 50.0 \sim 240.0 \mathrm{~V} \\ & 400 \mathrm{~V}: 100.0 \sim 480.0 \mathrm{~V} \\ & 575 \mathrm{~V}: 150.0 \sim 670.0 \mathrm{~V} \\ & \text { 690V: 200.0~804.0 V } \end{aligned}$ |
| 02-05 | Rated power of motor 1 |
| Range | 0.01~600.00 KW |
| 02-06 | Rated frequency of motor 1 |
| Range | $4.8 \sim 599.0$ Hz+ |
| 02-07 | Pole of motor 1 |
| Range | 2~16 |
| 02-09 | Excitation current of motor $1<1>$ |
| Range | 15.0~70.0 \% |
| 02-10 | Core saturation coefficient 1 of motor $1<1>$ |
| Range | 1~100\% |
| 02-11 | Core saturation coefficient 2 of motor $1<1>$ |
| Range | 1~100\% |
| 02-12 | Core saturation coefficient 3 of motor $1<1>$ |
| Range | 80~300 \% |
| 02-13 | Core loss of motor 1 |
| Range | 0.0~15.0 \% |
| 02-15 | Resistance between wires of motor 1 |
| Range | 0.001~60.000 $\Omega$ |

| Range | $200 \mathrm{~V}: 50 \sim 240 \mathrm{~V}$ |
| :--- | :--- |
|  | $400 \mathrm{~V}: 100 \sim 480 \mathrm{~V}$ |
|  |  |
|  | $690 \mathrm{~V}: 504 \sim 720 \mathrm{~V}$ |

Motor parameters are automatically set when performing an auto-tune (17-10=1). In most case no adjustment is required after performing an auto-tune except when using the inverter in special applications (e.g. machine tool, positioning, etc...).

Please refer to parameter group 22 for permanent magnet motor parameters.
(1) Number of motor poles (02-07)

Set the number of motor pole according to the motor nameplate.
(2) Motor rated power (02-05)

Set the motor power according to the motor nameplate.
(3) Motor rated current (02-01)

Set the motor rated current according to the motor nameplate.
(4) Motor rated voltage (02-04)

Set the motor rated voltage according to the motor nameplate.
Set the motor rated voltage and it will adjust maximum output voltage of V/F curve.
(5) Rated frequency of motor 1 (02-06)

Set the motor rated frequency according to the motor nameplate.
(6) Rated rotation speed of motor 1 (02-03)

Set the motor rpm according to the motor nameplate.
(7) No-load motor voltage (02-19)

Parameter determines the rated flux during motor's rated rotation in SLV or SV control mode. Set the value of this parameter to the same value as parameter 17-08. A value of 10~50V below the input voltage level ensures that the motor is capable of providing adequate torque performance when operating at nominal speed (or higher speed). Setting the value to small can result in a reduction in no-load current, weakened motor flux and an increase in motor current while the motor is loaded.
(8) Motor excitation current (02-09)

The current is obtained from rotational auto-tuning. It is required to perform manual tuning if the inverter cannot rotational auto-tune.

When the manual tuning is performed, tune it from $33 \%$ and observe no-load voltage (the output value) of parameter 12-67. If parameter 12-67 is higher than no-load voltage (the setting value) of parameter 17-08, perform downward revision in parameter 02-09; if it is lower than that, perform upward revision in parameter 02-09.

Tuning motor excitation current of parameter 02-09 will change motor leakage inductance of parameter 02-17 and motor mutual inductance of parameter 02-18.

It is required to refer to the actual no-load voltage of parameter 12-76 to tune the motor excitation current of parameter 02-09. Change of the excitation current will also affect the relative actual no-load voltage fluctuation so it is required to tune to the similar setting value of no-load voltage (17-08). 1
(9) Setting of motor core's saturation coefficient 1, 2 and 3 (02-10, 02-11, 02-12)

These parameters are automatically set during auto-tune. No adjustment required. Parameters are set to $50 \%$ for $02-10,75 \%$ for $02-11$ and $137.5 \%$ for $02-12$ to reduce the impact of core saturation. The motor core's saturation coefficient is defined as a percentage of the motor excitation current. When the motor flux reaches $137.5 \%$ level, the core's saturation coefficient shall be greater than $137.5 \%$. When the motor flux is $50 \%$ or $75 \%$, the core's saturation coefficient is required to be less than $50 \%$ and $75 \%$.

Im : 02-09 Excitation Current
Ks1: 02-10 Motor Core Saturation Coefficients 1
Ks2: 02-11 Motor Core Saturation Coefficients 2
Ks3: 02-12 Motor Core Saturation Coefficients 3
(10) Motor core loss (02-13)

Set motor core loss as the percentage of the motor rated power.

$$
\% W_{\text {core }}(02-13)=\frac{3 \times \text { Motor core loss (watt) }}{\text { Motor rated power (watts, 02-05) }} \times 100 \%
$$

Note: In V/F mode motor core loss (02-13) is used to for torque compensation.
(11) Motor line to line resistance (02-15)
(12) Motor no-load current (02-00).

Value is calculated based on the motor rated frequency (17-05) and motor rated current (17-03).
In V / F control mode, the output current is greater than the no-load current with slip compensation is enabled.
Note: The value of $02-01$ needs to be greater than the value set in parameter 02-00, otherwise warning message "SE01" out of range error will be displayed.

Figure 4.4.15 $Y$-equivalent model an induction motor

| 02-20 | No-Load Current of motor 2 |
| :---: | :--- |
| Range | $0.01 \sim 600.00 \mathrm{~A}$ |

| 02-21 | Rated current of motor 2 |
| :--- | :--- |
| Range | $10 \% \sim 200 \%$ of inverter's rated current |

| $\mathbf{0 2 - 2 2}$ | Rated rotation speed of motor 2 |
| :---: | :--- |
| Range | $0 \sim 60000 \mathrm{rpm}$ |

| 02-23 | Rated voltage of motor 2 |
| :--- | :--- |
|  | $200 \mathrm{~V}: 50.0 \sim 240.0 \mathrm{~V}$ |
| Range | $400 \mathrm{~V}: 100.0 \sim 480.0 \mathrm{~V}$ |
|  | $575 \mathrm{~V}: 150.0 \sim 670.0 \mathrm{~V}$ |
|  | $690 \mathrm{~V}: 200.0 \sim 804.0 \mathrm{~V}$ |

| 02- 24 | Rated power of motor 2 |
| :--- | :--- |
| Range | $0.01 \sim 600.00 \mathrm{~kW}$ |

| $\mathbf{0 2 - 2 5}$ | Rated frequency of motor 2 |
| :--- | :--- |
| Range | $4.8 \sim 599.0 \mathrm{~Hz}$ |

| 02-26 | Pole of motor 2 |
| :--- | :--- |
| Range | $2 \sim 16$ |

| $\mathbf{0 2 - 3 2}$ | Resistance between wires of motor 2 |
| :--- | :--- |
| Range | $0.001 \sim 60.000 \Omega$ |

Note: Motor $2 \mathrm{~V} / \mathrm{F}$ curve uses the same settings as motor 1 . The control mode setting for motor 2 is fixed to V/F.

| 02-33 | Proportion of Motor 1 Leakage Inductance $<1>$ |
| :--- | :--- |
| Range | $0.1 \sim 15.0 \%$ |

It is set by manual tuning function. Normally, it does not need to be adjusted because magnetic function does not exist in this adjustment.

$$
\xi=\frac{L l K g}{L r}
$$

Definition of leakage inductance proportion is the ratio of leakage inductance to rotor inductance. If the default value is set to $3.4 \%$, adjust this ratio will affect the motor leakage inductance parameter to be changed.

When the adjustment of leakage inductance proportion is larger or smaller, it will cause the motor jittering with abnormal noise and the motor cannot run. Generally, the adjusted value is $3.0 \% \sim 5.0 \% .4 .0 \%$ is the universal adjustment value that can make the motor run normally. The adjustment of leakage inductance proportion depends on the motor rating.

| 02-34 | Motor 1 Slip Frequency $<1>$ |
| :---: | :--- |
| Range | $0.1 \sim 20.0 \mathrm{~Hz}$ |

Normally, it is not required to be adjusted. It can be obtained via manual tuning parameter function. Such tuning does not have magnetic function.

The default value of motor slip is set to 1 Hz . Motor slip is obtained from the nameplate.
Take 60 Hz , 4-pole motor for example, synchronous speed: $\quad N=\frac{120 \times \text { Frequence }}{\text { Pole }}=\frac{120 \times 60}{4}=1800 \mathrm{rpm}$
Rated speed in the nameplate is 1700 rpm , then Slip $=\frac{1800-1700}{60}=1.67 \mathrm{~Hz}$ 。
Adjusting motor slip will change the rotor resistance parameter. The motor slip is adjusted depending on the motor performance.

| 02-37 | Motor Mechanical Loss |
| :--- | :--- |
| Range | $0.0 \sim 10.0 \%$ |

Adjustment range of mechanical loss is $0.0 \sim 10.0 \%$. It is enabled only in the speed mode and the speed command being 0 .
If the speed command is 0 and the shaft will be at slow drift causing to be static incompletely, adjust upwards the range of mechanical loss until the shaft is completely static.

Note: After executing auto-tuning, parameters which marked $<1>$ will renew the value. Please refer Group 17:
Automatic Tuning Parameters for more detail.

$03-0 X=00$ : 2 -wire control: forward operation
$\mathbf{0 3 - 0 X}=\mathbf{0 1}$ : 2 -wire control: reverse operation. Refer to the 2-wire operation mode in Figure 4.4.1.

03-0X $=02$ : Multi-speed/position setting command 1 .
03-0X =03: Multi-speed/position setting command 2.
03-0X =04: Multi-speed/position setting command 3 .
$03-0 X=05$ : Multi-speed/position setting command 4 (setting $=05$ ).
Select frequency reference using multi-function digital input.
In SV or PMSV mode (00-00=3, 4), with 03-00~07 set to 51 , multi-speed command can be used to select multiple segment positions.
$03-0 X=29:$ Jog frequency selection (setting =29). Select frequency reference using the multi-function digital input. In SV or PMSV mode ( $00-00=3,4$ ), with $03-00 \sim 07$ set to 51 , multi-speed command can be used to select multiple segment positions.

Table 4.4.28 Multi-speed operation selection

| Speed | Multi-function digital input (S1 to S8) |  |  |  |  | Frequency selection |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Jog frequency reference | Multi-speed frequency 4 | Multi-speed frequency 3 | Multi-speed frequency 2 | Multi-speed frequency 1 |  |
| 1 | 0 | 0 | 0 | 0 | 0 | Frequency command 0(05-01) or main speed frequency ${ }^{* 2}$ |
| 2 | 0 | 0 | 0 | 0 | 1 | Auxiliary speed frequency $\quad(04-05=0)$ or frequency reference 1 (05-02) ${ }^{* 3}$ |
| 3 | 0 | 0 | 0 | 1 | 0 | Frequency command 2 ( 05-03) |
| 4 | 0 | 0 | 0 | 1 | 1 | Frequency command 3 ( 05-04) |
| 5 | 0 | 0 | 1 | 0 | 0 | Frequency command 4 ( 05-05) |
| 6 | 0 | 0 | 1 | 0 | 1 | Frequency command 5 ( 05-06) |
| 7 | 0 | 0 | 1 | 1 | 0 | Frequency command 6 ( 05-07) |
| 8 | 0 | 0 | 1 | 1 | 1 | Frequency command 7 ( 05-08) |
| 9 | 0 | 1 | 0 | 0 | 0 | Frequency command 8 ( 05-09) |
| 10 | 0 | 1 | 0 | 0 | 1 | Frequency command 9 ( 05-10) |
| 11 | 0 | 1 | 0 | 1 | 0 | Frequency command 10(05-11) |
| 12 | 0 | 1 | 0 | 1 | 1 | Frequency command 11 ( 05-12) |
| 13 | 0 | 1 | 1 | 0 | 0 | Frequency command 12 ( 05-13) |
| 14 | 0 | 1 | 1 | 0 | 1 | Frequency command 13(05-14) |
| 15 | 0 | 1 | 1 | 1 | 0 | Frequency command 14 ( 05-15) |
| 16 | 0 | 1 | 1 | 1 | 1 | Frequency command 15 ( 05-16) |
| 17 | $1^{* 1}$ | - | - | - | - | Jog frequency command (00-18) |

0: OFF, 1: ON, -: Ignore
*1. Jog frequency terminal has a higher priority than multi-speed reference 1 to 4 .
*2. When parameter $00-05=0$ (frequency reference input = digital operator), multi-speed frequency 1 will be set by $05-01$ frequency reference setting1). When parameter $00-05=1$ (frequency reference input=control circuit terminal), multi-speed frequency command 1 is input through analog command terminal Al1 or Al2).
*3. Default setting of analog input (Al2) is auxiliary frequency. When $04-05 \neq 0$, multi-speed frequency reference is set by 05-02. When PID control mode 10-03=xxx1b (PID Enable), even though 03-00~03-07=16 (PID Control Disable), the auxiliary frequency cannot be switched.

Wiring Example: Figure 4.4.17 and 4.4.18 show an example of a 9 -speed operation selection.

Figure 4.4.17 Control Terminal Wiring Example

Figure 4.4.18: 9 -speed timing diagram
*1. When $00-05=1$, multi-speed frequency reference is set by analog input Al1 or Al2. When $00-05=0$, multi-speed frequency reference is set by 05-01.
*2. When 04-05=0, multi-speed frequency reference is set by Auxiliary frequency (Al2). When 04-05 $=0$, multi-speed frequency reference is set by 05-02.

03-0X =06: Forward jog run command, uses jog frequency parameter 00-18.

## Note:

- Jog command has a higher priority than other frequency reference commands.
- Jog command uses stop mode set in parameter 07-09 when Jog command is active $>500 \mathrm{~ms}$.

03-0X =07: Reverse jog run command, uses jog frequency parameter 00-18.

## Note:

- Jog command has a higher priority than other frequency reference commands.
- Jog command uses stop mode set in parameter 07-09 when Jog command is active $>500 \mathrm{~ms}$.

03-0X $=\mathbf{0 8}$ : UP frequency accelerating command; set parameter 00-05 Frequency command to 2 to activate.
$\mathbf{0 3 - 0 X}=\mathbf{0 9}$ : Down frequency decelerating command; set parameter 00-05 Frequency command to 2 to activate.

## Note:

- The inverter operates the variation of increasing/ decreasing output frequency via keypad (refer to parameter 11-56) / external multi-function digital input (terminal S1to S8) when the motor is running.
- It is required to use two terminals to run UP/ DOWN command when the inverter runs this command via the external multi-function digital input terminal and $00-02=1$ (external terminals) \& 00-05=2 (terminal command UP/DOWN) \& 03-00~03-07=8 (UP command)/ 9 (DOWN command).
- The inverter output frequency runs UP/ DOWN command with the setting of acceleration/ deceleration time.

Note: SE02 DI terminal Error will be displayed when:

- Only the UP or DOWN command function is set.
- Both UP command and Inhibit Acceleration/deceleration command are activated simultaneously.
- Both DOWN command and Inhibit Acceleration/deceleration command are activated simultaneously.

For the examples of UP/DOWN control wiring and operation, please refer to figure 4.4.19 and 4.4.20.

Figure 4.4.19 UP/DOWN wiring and operation example

Figure 4.4.20 Up / Down command timing diagram

## UP / DOWN Command Operation

When the Forward Run command is active and the UP or Down command is momentarily activated the inverter will accelerate the motor up to the lower limit of the frequency reference (00-13).

When using the UP / Down command, the output frequency is limited to the upper limit of frequency reference (00-12) and the lower limit of frequency reference (00-13).

The UP / DOWN command uses acceleration 1 or 2 / deceleration time 1 or 2 for normal operation Tacc 1 / Tdec1 (00-14, 00-15) or Tacc2 / Tdec 2 (00-16, 00-17).
*Refer to parameter 03-40 of UP/ Down frequency width setting for other functions of UP / Down.

Frequency reference retention is active when parameter 11-58 is set to 1 and the frequency reference is saved when power is lost and retrieved when power is restored.
*1: When 11-58 = 1 and the operation command is active, the output frequency will accelerate to the previously stored frequency command.
*2: When $11-58=0$ and the operation command is active, the output frequency will accelerate to the lower limit of frequency reference (00-13).

## 03-0X =10: Acceleration/deceleration 1 selection

## 03-0X =30: Acceleration/deceleration 2 selection

Refer to the "multi-function digital input terminals select acceleration / deceleration time" page 4-76.
03-0X =11: Acceleration/deceleration inhibition command (hold command)
When acceleration/deceleration inhibition command is active, inverter suspends the motor's acceleration / deceleration operation and maintains the output frequency at current level. Refer to the record reference frequency (parameter 11-58).
*1. 11-58 = 1 ,
When acceleration / deceleration inhibition command is activated, the frequency reference is stored even when powering down the inverter.

When a run command is given (e.g. run forward) and the acceleration / deceleration inhibit command is active, the inverter will accelerate to the previously stored frequency reference.
*2. 11-58 = 0 ,
When acceleration / deceleration inhibition command is ON, the motor suspends at the output frequency which is the frequency reference command.

When acceleration / deceleration inhibition command is OFF or inverter stop command is active, the frequency reference command will restore to the pre-set frequency. The output frequency remains at 0 Hz when the stop command and power down reset.

Note: If acceleration / deceleration inhibition command is ON before operation, STP0 signal will occur after operation because there is no record reference frequency.

Refer to Figure 4.4.21. for an example.

Figure 4.4.21 Acceleration/ deceleration inhibition command operation

## 03-0X =12: Main/ Alternative Run Switch Function

When function terminals conduct, run command source is set in alternative run command (00-03). When functional terminal is set to 27 (Local/ Remote control selection), it will be precedential to main/alternative run switch.
$03-0 X=13$ : Main/ Alternative Frequency Switch Function
When function terminals conduct, frequency command source is set in alternative frequency command (00-06). When functional terminal is set to 27 (Local/ Remote control selection), it will be precedential to main/alternative frequency switch. When PID function is active(10-03=XXX1B), this function is invalid and main frequency is switched to PID function. When PID function is invalid, Main/ Alternative frequency switch function is valid then.

03-0X =14: Emergency stop (decelerate to zero and stop)
Refer to the "deceleration time of emergency stop" of parameter 00-26
03-0X =15: External Baseblock Command (coast to stop)
Execute the base block command by the use of ON / OFF way of multi-function digital input terminal, and prohibit
the inverter output.

During run: When an external base block command is activated, the keypad displays "BBn BaseBlock (Sn)", indicating the inverter output is turned off ( n indicates the digital input number $1-8$ ). Upon removing the base block signal, the motor will run at the frequency reference. If speed search from frequency reference is active the inverter output frequency starts from the frequency reference and searches for the coasting motor speed and continue to operate. If speed search is not active the output frequency starts at 0 Hz .

During deceleration: When an external base block command is activated, the keypad displays "BBn BaseBlock $(\mathrm{Sn})$ ", indicating the inverter output is turned off ( $n$ indicates the digital input number $1-8$ ). Upon removing the base block signal, the motor is stopped or will coast to a stop and the inverter will remains in the stop condition.

During acceleration: When an external base block command is activated, the keypad displays "BBn BaseBlock $(\mathrm{Sn})$ ", indicating the inverter output is turned off ( n indicates the digital input number $1-8$ ). Upon removing the base block signal, the motor will run at the frequency reference. If speed search from frequency reference is active the inverter output frequency starts from the frequency reference and searches for the coasting motor speed and continue to operate. If speed search is not active the output frequency starts at 0 Hz .

Figure 4.4.22 External base block operation
03-0X =16: PID control disabled.

## $03-0 X=17$ : Fault reset

The output becomes active when the inverter trips on a fault. Upon an inverter fault the inverter output will turn off (base block) and the keypad displays the dedicated fault message.

When fault occurs, the following actions can be used to reset the fault:

1. Program one of the multi-function digital inputs (03-00 to 03-07) to 17 (reset fault) and active input.*
2. Press the reset key of the digital operator (RESET).*
3. Recycle power to the inverter.

Important Note: If a run command is active during power-up, the inverter will start running automatically.

* To reset an active fault the run command has to be removed.

03-0X =19: Speed Search 1 (from the maximum frequency).
03-0X =34: Speed Search 2 (from the frequency command).
Refer to the "speed search" function.
03-0X =20: Energy saving enabled
Manual energy savings function is set with parameters 11-12 and 11-18.
For the manual energy saving operation refer to Figure 4.4.88.
03-0X =21: PID integral reset
03-0X =24: PLC Input
It is required to be with the software of Drive Link. PLC software program conducts the ladder diagram editing. When the signal output conducts, it will be transmitted to the inverter to be active.

## $03-0 \mathrm{X}=25$ : External fault

Activating the external fault input will turn off the inverter output and the motor will coast to a stop. The keypad displays the external fault message "EFn Ext. Fault (Sn)", where n is the input terminal number.

03-0X =26: 3 -wire sequence (forward / reverse command)
When digital input terminals S3~ S6 are set to 26, terminals S1 and S2 will be individually changed to run command and sop command. Refer to the 3 -wire operation mode in Figure 4.4.2 for details.

03-0X $=27$ : Local / Remote selection.
Switch the inverter frequency reference source between Local (keypad) or Remote (control circuit terminals or RS485). Use parameter 00-05 (Main frequency command source selection) and 00-02 (Run command selection) to select the remote source.

Note: In 3-wire operation terminal S1 and S2 are reserved for run/stop operation and the Local / Remote function can only be set to digital input terminals S 3 to $\mathrm{S8}$ (03-02 to 03-07).

Note: To switch between local and remote the inverter has to be stopped.

| Input | Mode | Frequency Reference / Run/Stop Command Source |
| :---: | :---: | :--- |
| ON | Local | - Frequency reference and Run-Stop from keypad. <br> - LEDs SEQ and REF are off. |
| OFF | Remote | - Frequency reference source selected by parameter 00-05 and <br> Run-Stop source selected by parameter 00-02. <br> - LEDs SEQ and REF are on. |

03-0X =28: Remote mode selection
Switch between terminal source and communication (RS-422/RS-485) source for frequency reference and operation command.

In Remote mode, indicators of SEQ and REF are on; you can use terminals Al1 and AI2 to control the frequency command, and use terminals S1, S2 or communication terminal RS-485 to control the operation command.

| Input | Mode | Frequency Reference / Run/Stop Command Source |
| :---: | :---: | :--- |
| ON | Communication | - Frequency reference and run/stop command control via communication <br> $(R S-422 / R S-485)$. |
| OFF | Terminal | - Frequency reference source from $\mathrm{Al1} / \mathrm{Al2}$ input $(00-05=1)$ and <br> Run-Stop command from terminals $\mathrm{S} 1 / \mathrm{S} 2(00-02=1)$. |

Figure 4.4.23 Remote mode operation selection
To switch the frequency reference and operation command input between communication RS-485 and control terminals the following parameters have to be set:

1. $00-05=1$ (use control terminal Al 1 or Al 2 as reference frequency source)
2. $00-02=1$ (use control terminal S 1 or S 2 for operation command)
3. Set one of the digital input terminals (03-02 to 03-07) to 28 (Operation selection of remote mode)

## 03-0X =24: PLC Input

It is required to match Drive Link program. Ladder diagram is edited in the PLC program. When the message output is conducted, this message will be sent to the inverter.

03-0X =26: 3-Wire Sequence (Forward/ Reverse Command)
When the digital input terminals (S3~S6) is set to 26 , terminal S1 and S2 will become the run command and stop command. Refer to Fig.4.4.2.

## 03-0X =29: Jog Frequency Selection

When jog frequency selection is on, the inverter will depend on the parameter 00-18 (jog frequency) as the command.

03-0X =30: Acceleration/ Deceleration Time Selection 2
When accel./ decel. time selection 2 is ON, the inverter will depend on the parameter 00-16 acceleration time 2 and the parameter 00-17 deceleration time 2.

03-0X =31: Inverter overheat warning
When input is active the inverter displays warning message "OH2" and continues operation. Deactivating the input reverts back to the original display. Warning message does not require resetting the inverter.
$03-0 X=32$ : Sync command
Selects between frequency reference source from pulse input or frequency reference source selected by parameter 00-05.

| Input | Ref. Source | Frequency Reference / Run/Stop Command Source |
| :---: | :---: | :--- |
| ON | Pulse Input | - Frequency reference set by pulse input |
| OFF | Parameter 00-05 | - Frequency reference source selected by parameter 00-05 |

## Note:

- Function is disabled when the Local/Remote selection (25) or Remote mode selection (26) is active.
- To switch between local and remote the inverter has to be stopped.

03-0X =33: DC braking
When input is active DC-Injection braking is enabled during start and stopping of the inverter.
DC Injection braking is disabled when a run or jog command is active. Refer to the DC braking time diagram in Figure 4.4.24.

Note: Short-circuit braking command or DC braking command can only be selected. If they are set simultaneously, SE02 error (DI Terminal Error) will occur.

Figure 4.4.24 DC braking timing diagram
$03-0 X=35$ : Timing function
Refer to the "time function" parameter 03-37 and 03-38.

03-0X =36: PID Soft start disable
Refer to the "PID Control" function of PID function parameter group 10.
03-0X =37: Traverse operation

03-0X =38: Upper Deviation of traverse operation
03-0X =39: Lower Deviation of traverse operation
See "Wobble Frequency" function in parameter group 19
$03-0 X=40$ : Switching between motor 1 and motor 2
03-0X =41: PID Sleep
Set parameter 10-29 to 2 (active by DI) and refer to the descriptions of parameters 10-17~10-20.
03-0X =42: PG disable
When input is active PG feedback is disabled and speed control is set to V/F control.
03-0X =43: PG integral reset
When input is active, reset PG speed control integral accumulator.
Note: Only applies to closed loop control modes.
03-0X =44: Mode switching between speed and torque
Active in SV (sensor vector control mode). When input is active switch control between speed and control mode.
Refer to parameter group 21 for more information.

| Input | Control |
| :---: | :---: |
| ON | Torque Control |
| OFF | Speed Control |

$03-0 X=45$ : Negative torque command
When input is active reverses torque reference command. Refer to Figure 4.4.128 for more details.
03-0X =46: Zero-servo Command; Start: zero-servo operation.
When input is active starts zero-servo operation. Refer to Figure 4.4.129 for more details.
$03-0 X=47$ : Fire mode
When input is active disables all inverter warning and hardware protections. This function is commonly used in commercial applications where the inverter controls an exhaust fan and needs run to destruction in case of a fire.

03-0X =48: KEB acceleration
When input is active enables KEB (Kinetic Energy Braking) during acceleration. Refer to the parameter description of 11-47 and 11-48. Note: To enable set parameter 11-47 to a value greater than 0 .

03-0X =49: Parameters write-in allowed
When input is active allows parameter to be changed.
Note: When none of the digital input terminals are set to function 49, parameter write-in protection is controlled by parameter 13-06.

| Input | Parameter Save |
| :---: | :---: |
| ON | Parameters Write Enabled |
| OFF | Parameters Write Protected |

03-0X =50: Unattended Start Protection (USP)
When input is active prevents inverter from starting automatically when a run command is present at time of power-up. Please refer to Figure 4.4.24a for more details.

Figure 4.4.24a Unattended Start Protection
$03-0 X=51$ : Mode switching between speed and position control.
Refer to the parameter description of 21-09 ~ 21-41

| Input | Control |
| :---: | :---: |
| ON | Position Control |
| OFF | Speed Control |

## 03-0X =52: Multi Position Reference Enable

Refer to the parameter description of 21-09~21-41
03-0X =53: 2-Wire Self-holding Mode (Stop Command)
Refer to parameter description of 00-02 (2-wire operation with self-holding function)
$03-0 X=58$ : Safety function
When safety function is on, the inverter will stop depending on the setting of 08-30 after the digital terminal is active.
$03-0 X=62$ : EPS function
EPS input is valid when low voltage activate. Please refer to page 4-84
03-0X $=65$ : Short-circuit braking
To stop inverter by turning on Short-circuit braking with setting terminal. If executing run command or jog command, short-circuit braking command will erased and start to run. The following picture is short-circuit braking time process.

Note: Short-circuit braking command or DC braking command can only be selected. If they are set simultaneously, SE02 error (DI Terminal Error) will occur.

## 03-0X =66: PID Disabled 2

When PID is disabled, the main frequency command source (00-05) is active; when PID is enabled, the previous frequency command is integrated and PID mode is active.

## 03-0X =67: Manual Pulse Generator Mode Switch

When $00-32=8$ (HMPG), MPG switch mode is enabled. The frequency command in general mode runs depending on analog input Al1 and that in MPG mode runs depending on pulse input. Please refer to the following diagram for further descriptions.

Descriptions of MPG action sequence number:

- 1: When run command starts, the injection current is determined by parameter 07-46 during the braking action from DC current injection motor. When run command is canceled, DC current injection stops.
- 2: When MPG speed is higher than the minimum output frequency of motor 1 (parameter 01-08), the inverter starts output frequency by $\mathrm{V} / \mathrm{f}$ curve. If the output torque is inadequate, please set up the $\mathrm{V} / \mathrm{f}$ cure parameters of 01-06, 01-07, 01-08, 01-09.
- 3: When MPG speed is higher than the speed command limit of parameter 20-44, the inverter output frequency will be limited to the set rotation speed by parameter 20-44.
- 4: When MPG stops running (stop pulse input), the motor speed will start to decelerate depending on the
set value of deceleration time 2 (parameter 00-17). When the motor speed is lower than the minimum output frequency of motor 1 , the motor will start DC current injection brake action.

Note: When MPG generates pulse input to PG card, the speed command will be calculated. Then, the speed command is multiplied by the speed magnification (parameter 20-43). It is filtered by the set ASR delay time (parameter 20-08). Selection of PG rotation direction (Parameters 20-28) can be set to determine if the MPG and the motor rotation are in the same direction.

Note: When V/f curve parameters 01-06, 01-07, 01-08 and 01-09 are adjusted, it is necessary to note the inverter output current (parameter 12-18) to avoid all kinds of fault conditions leading to possible industrial safety accidents.
$>$ Please refer to the following flow chart for the Parameter Setting:

03-0X $=68$ : External Fault 2

- When an external fault occurs, the external fault 2 input terminal is turned on, the inverter will be turned off and the motor will free run to stop.
- If external input terminal S 3 is set $(03-02=68$ ) as external fault, the message "EF3 Ext. Fault (S3)" (EF3) will be displayed.
- All eight input terminals (S1 to S8) can be designated as external fault input.
$03-0 X=69$ : External Overload, input terminal is normally closed.
- When external overload occurs, the external overload input terminal closed, the inverter will be turned off and the motor will decelerate to stop.
- If the external input terminal S5 is set $(03-04=69)$ to external overload, "TOL Ext. OverLoad" message will be displayed.
- To enable the external overload function, the fire mode must be enabled first (08-48 =1), only the external input terminal S5 can be designated as External Overload Input.
- Setting the external input terminal as External Overload will set the input terminal as the normally closed, therefore, before setting the external overload function, do not set the operation command from the external terminal, otherwise, it will cause unnecessary damage.

| 03-08 | (S1~S8) DI scan time |
| :---: | :--- |
| Range | 0: scan time 4 ms <br> $1:$ scan time 8 ms |

Set the digital input CPU scan time. The digital input signal needs to be present for the minimum scan time to qualify as a valid command.
Note: For noisy environments select scan time of 8 ms (results in a slower response time).

| 03-09 | Multi-function terminal S1-S4 type selection |  |  |

| contact |  |  |  |
|  | $0 x x x b: S 8 A$ | contact | $1 x x x b:$ S8 B |
| contact |  |  |  |

Parameter 03-09 and 03-10 selects the digital input type between a normally open and a normally closed switch/contact.

Each bit of 03-09/03-10 presents an input:

Example: S 1 and S 2 wired to a normally closed contact / switch set 03-09=0011.

Do not set the operation command parameter 00-02 to terminal control before setting the digital input type. Failure to comply may cause death or serious injury.

| :---: | :--- |
| ON | Run command is ON or output frequency is greater than 0. |

## 03-1X=1: Fault contact output

Output is active during fault condition.
Note: Communication error (CF00, CF01) do not activate the fault contact.

## 03-1X=2: Frequency Agree

Output is active when the output frequency falls within the frequency reference minus the frequency detection width (03-14).

## 03-1X=3: Setting Frequency Agree

Output is active when the output frequency falls within the frequency detection width (03-14) of the set frequency detection level (03-13).

## $03-1 \mathrm{X}=4$ : Frequency detection 1

Output is active when the output frequency rises above the frequency detection level (03-13) + frequency detection width (03-14) and deactivates when the output frequency falls below frequency detection level (03-13).

## 03-1X=5: Frequency detection 2

Output is active when the output frequency is below the frequency detection level (03-13) + frequency detection width (03-14) and turns off when the output frequency falls below frequency detection level.

Refer to table 4.4.30 for the operation of frequency detection.
03-1X=6: Automatic restart.
Output is active during an auto-restart operation.
03-1X=9: Baseblock (B.B.)
Output is active when the inverter output is turned off during a Baseblock command.
03-1X=12: Over torque detected (Normally Open)
Output is active during an over torque detection see parameters 08-13 ~ 08-16.
03-1X=25: Low torque detected (Normally Open)
Output is active during low torque detection see parameters 08-17 ~ 08-20.
03-1X=13: Current Agree
When output current > 03-15 and output current > 03-15 duration $>03-16$, it is ON.
$03-1 \mathrm{X}=18$ : PLC status (setting = 18)
Output is active when operation command parameter (00-02) is set to 3 : PLC Control.
03-1X=19: PLC control contact
Output is controlled by the PLC logic
03-1X=20: Zero-speed
Output is active during zero-speed

| Active | Output frequency <=minimum output frequency (01-08, Fmin) |
| :---: | :--- |
| Off | Output frequency is>=the minimum output frequency |

Figure 4.4.26 Zero-speed operation

## 03-1X=21: Inverter Ready

Output is active when no faults are active and the inverter is ready for operation.
03-1X=22: Under voltage Detection
Output is active when the DC bus voltage falls below the low voltage detection level (07-13).
03-1X=23: Source of operation command
Output is active in local operation command.

| OFF | Remote mode: <br> $00-02=1$ or 2, or any one of the multi-function digital input terminals (S1 to S8) set to <br> function 5 (LOCAL / REMOTE control) is OFF. <br> SEQ LED of the keypad is ON. |
| :--- | :--- |
| ON | Local mode: <br> $00-02=0$, or any one of the multi-function digital input terminals (S1 to S8) set to <br> function 5 (LOCAL / REMOTE control) is active. <br> SEQ LED of the keypad is OFF. |

03-1X=24: Source of frequency command
Output is active in local frequency command.

| OFF | Remote mode: <br>  <br> ON <br>   <br>  <br>  |
| :---: | :--- |
|  |  |
|  | $00-05=0$, or any one of the multi-function digital input terminals (S1 to S8) set to <br> function 5 (LOCAL / REMOTE control) is active. <br> REF LED of the keypad is OFF. |

03-1X=26: Frequency reference missing
Output is active when the frequency reference is lost. When parameter $11-41$ is set to 0 the inverter will decelerate to a stop. When parameter 11-41 is set to 1 operation will continue at the value of parameter 11-42 times the last know frequency reference.

03-1X=27: Time function output
Output is controlled by timer function see parameter 03-37 and 03-38.

03-1X=28: Traverse operation UP status
Output is controlled by frequency wobbling operation; refer to Parameter group 19 for details.
03-1X=29: During Traverse operation status
Output is controlled by the acceleration period or frequency wobbling operation, refer to Parameter group 19 for details.

03-1X=30: Motor 2 selected
Output is active when motor 2 is selected.
03-1X=31: Zero Servo Status (Position mode)
Output is active when Zero-servo operation is enabled and the load is locked into position.
03-1X=32: Communication control contacts
Communication location: 2507H, control by RY3 RY2 RY1.RY3 and RY2 will execute if DO1,DO2 and DO3 all set communication control, and 2507 H set 5 (101)

## 03-1X=37: PID Feedback Loss Detection Output

When PID feedback loss occurs (refer to the setting of parameters 10-11~10-13), it performs the state of ON.
03-1X=38: Brake Release
The state of ON means release brake is active. Refer to parameters 03-41~03-42 for the details.
03-1X=39: Frequency Detection 1 (dedicated for Crane)
$03-1 \mathrm{X}=40$ : Frequency Output
Refer to Table 4.4.30 for the operation of frequency detection.
03-1X=41: Position Agree (Position Mode)
Position search is completed at position mode, then ON.
03-1X=45: PID Sleep
It will inform when PID sleep ON.
03-1X=50: Frequency Detection 3
Please refer to Table 4.4.9 Frequency detection operation
03-1X=51: Frequency Detection 4
Please refer to Table 4.4.9 Frequency detection operation
03-1X=52: Frequency Detection 5
Please refer to Table 4.4.9 Frequency detection operation
03-1X=53: Frequency Detection 6
Please refer to Table 4.4.30 Frequency detection operation
$03-1 \mathrm{X}=54$ : Turn on short-circuit braking
Output terminal is closed when Turning on short-circuit braking
03-1X=57: Low Current Detection
When output current $<=03-48$, relay is active.
03-1X=58: Frequency Deceleration Detection
When output frequency < frequency command- 03-14 in deceleration, the relay is active. Please refer to Table
4.3.30 Frequency detection operation

03-1X=59: Over Temperature Detection
The Heat Sink Temperature > 08-46, the relay is active, the Magnetic Hysteresis Zone is set by 08-47.

| $\mathbf{0 3 - 1 3}$ | Frequency detection Level |
| :---: | :--- |
| Set Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| 03-14 | Frequency detection width |
| :---: | :--- |
| Range | $0.1 \sim 25.5 \mathrm{~Hz}$ |

Frequency detection Level: set the multi-function output terminals R1A-R1C, R2A-R2C or PH1 (03-11, 03-12 or $03-28)$ to the desired detection level and bandwidth for use with multi-function output functions 2 to 5 .

The time charts for the Frequency Agree Detection operation are shown in the following table 4.4.9.

| $\mathbf{0 3 - 4 4}$ | Frequency Detection Level 2 |
| :--- | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| $\mathbf{0 3 - 4 5}$ | Frequency Detection Width 2 |
| :---: | :--- |
| Range | $0.1 \sim 25.5 \mathrm{~Hz}$ |

| $\mathbf{0 3 - 4 6}$ | Frequency Detection Level 3 |
| :--- | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| $\mathbf{0 3 - 4 7}$ | Frequency Detection Width 3 |
| :--- | :--- |
| Range | $0.1 \sim 25.5 \mathrm{~Hz}$ |

| $\mathbf{0 3 - 5 0}$ | Frequency Detection Level 4 |
| :---: | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| 03-51 | Frequency Detection Level 5 |
| :--- | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| 03-52 | Frequency Detection Level 6 |
| :--- | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

Frequency Detection : Set R1A-R1C , R2A-R2C or PH1 (03-11, 03-12 or 03-28) to output frequency signal and then set frequency confirmation and output frequency detection 1~6.
Please refer to table 4.4.30.detection operation of frequency time block

Table 4.4.30 Frequency detection operation

| $\mathbf{0 3 - 1 5}$ | Current Agree Level |
| :--- | :--- |
| Range | $0.1 \sim 999.9 \mathrm{~A}$ |
| $\mathbf{0 3 - 1 6}$ | Delay Time of Current Agree Detection |
| Range | $0.1 \sim 10.0$ Sec |
| $\mathbf{0 3 - 5 3}$ | Current Agree Level 2 |
| Range | $0.0 \sim 999.9 \mathrm{~A}$ |

Note: The Maximum Value of 03-53 will be limited by Setting Value of 03-15
$03-11=13$, then,
When the output current $>03-15$, relay is active.
$03-15$ : The suggested setting value is $0.1 \sim$ the motor rated current.

03-16: The delay time performs depending on the setting value. In addition, when the Output Current is $\leq 03-53$, the delay time from ON to OFF in the signal of relay is 100 ms (constant).

## Time Diagram:

| $03-48$ | Low Current Detection Level |
| :--- | :--- |
| Range | $【 0.0 \sim 999.9$ 】 A |
| $03-49$ | Low Current Detection Delay Time |
| Range | $【 0.00 \sim 655.34 】$ Sec |

03－11 set to 57：When output current＜＝03－48（Low current detection level），the relay works．
When 03－48 set 0．0，low current detection function disabled．
If the detection time is bigger than the setting time of 03－49，the relay works．
Besides，the relay delay time from ON to OFF is 100 ms ，and it＇s fixed．

The timing chart：

| 03－17 | Mechanical Braking Release Level |
| :--- | :--- |
| Range | $0.00 \sim 599 \mathrm{~Hz}$ |

| 03－18 | Mechanical Braking Level Set |
| :--- | :--- |
| Range | $0.00 \sim 599 \mathrm{~Hz}$ |

When $03-11=14$ ，the real frequency equal to the value of 03－17（Mechanical Braking Release Level）in acceleration time，the relay output will execute．
When $03-11=14$ ，the real frequency equal to the value of $03-18$（Mechanical Braking Level Set）in deceleration time，the relay output will stop execute．

When $03-17 \leq 03-18$ ，the timing diagram is as follows：

When 03-17 $\geq 03-18$, the timing diagram is as follows::

| 03-19 | Relay (R1A-R2C) type |  |  |
| :---: | :--- | :--- | :--- |
| Range | xxx0b: R1 A | contact | xxx1b: R1 B |
|  | xx0xb: R2 A | contact | $x x 1 x b: ~ R 2 ~ B ~$ | contact |  |
| :---: |

Parameter 03-19 selects the digital output type between a normally open and a normally closed contact.
Each bit of 03-19 presents an output :

$03-19=$| $\underline{0}$ | $\underline{0}$ | 0: normally open contact |
| :--- | :--- | :--- |
| R2 | R1 | 1: normally close contact |

Example: R1 normally open and R2 normally closed contact set 03-19=xxx01.

| 03-27 | UP/DOWN Frequency Hold/Adjust Selection |
| :--- | :--- |
|  | 0: Hold last set frequency when stopped <br> Range |
|  | 1: Set frequency to 0 when stopped <br> 2: Allow speed changes from last set frequency when stopped <br> 3: Refresh frequency at acceleration |

$\mathbf{0 3 - 2 7}=0$ : When the run command is removed the UP/DOWN frequency reference before deceleration is stored. The next time the run command is applied the output frequency will ramp up to the previously stored frequency reference.

03-27=1: When the run command is removed the UP/DOWN frequency reference command is cleared (set to 0). The next time the run command is applied the output frequency will start at 0 .

03-27=2: UP/DOWN command is active when run command is not active.

03-27=3: Keep the state of frequency command not to be cleared. When run command re-sends, press UP/DOWN key before the run frequency reaches the frequency command.

| 03-40 | Up/Down Frequency Width Setting |
| :---: | :--- |
| Range | $0.00 \sim 5.00 \mathrm{~Hz}$ |

When $03-40$ is set to 0 Hz , Up / Down function is maintained.
When $03-40$ is not set to 0 Hz , frequency command is set by the run frequency plus the setting frequency of 03-40.

Example: set terminal S1: 03-00=8 (Up increased frequency command), terminal S2: 03-01=9 (Down decreased frequency command) and $03-40=\Delta \mathrm{Hz}$.

Mode 1: When 03-40 is set to $0 \mathrm{~Hz}, \mathrm{Up} /$ Down function is maintained. Refer to Fig. 4.4.20.

Mode 2: When $03-40$ is not set to 0 Hz and terminals conduction time $<2 \mathrm{Sec}$, frequency change ( $\Delta \mathrm{Hz}$ ) at one conduction occurs depending on the setting of 03-40.

Mode 3: When $03-40$ is not set to 0 Hz and terminals conduction time $>2$ Sec, frequency changes upon general acceleration/ deceleration.

※Descriptions:
$\Delta \mathbf{H} 1$ : frequency increment setting at acceleration, $\mathbf{t 1}$ : terminal conduction time at acceleration,
$\Delta \mathrm{H} 2$ : frequency increment setting at deceleration, $\mathbf{t 2}$ : terminal conduction time at deceleration.
$\Delta H 1=\frac{\text { UpperLimitFrequency }}{\text { Acceleration Time } 2} \times$ TerminalConductionTime $(t 1)$
$\Delta H 2=\frac{\text { UpperLimitFrequency }}{\text { DecelerationTime } 2} \times$ TerminalConductionTime (t2)

| $\mathbf{0 3 - 2 8}$ | Photo-coupler Output (DO1-DOG) |
| :--- | :--- |
| Range | See function selection list parameter 03-11 |

| 03-29 | Photo-coupler Output Selection (DO1-DOG) |
| :---: | :--- |
| Range | $\mathrm{xxx0b}$ : Photo-coupler A Contact $\quad \mathrm{xxx1b}$ : Photo-coupler B Contact |

$0=$ Normally open (A), $1=$ Normally closed (B)

| $03-30$ | Function setting of pulse input |
| :--- | :--- |
| Range | $0:$ General Pulse Input <br> $1:$ PWM |

There are two ways for pulse input selection:
(1) General pulse input:
$\mathrm{Pl}=$ cutoff frequency divided by pulse input scale set by 03-31, corresponding to the maximum output frequency of motor 1 (01-02).

Monitoring parameter 12-79 (pulse input percentage) is the proportional relationship between input signal and pulse input scale of 03-31.
(2) PWM: It is required to input the correct frequency.

PWM = Time of positive edge pulse divided by the time period of pulse, corresponding to the maximum output frequency of motor 1 (01-02).

Monitoring parameter 12-79 (pulse input percentage) is the proportional relationship between the positive edge terminal of input signal and time period.

Note: Deviation of pulse time period in PWM is $\pm 12.5 \%$. If it is over the deviation range, pulse input is not active.
Diagram for pulse input selection:

| $\mathbf{0 3 - 3 1}$ | Scale of pulse input |
| :--- | :--- |
| Range | Depending on the setting of 03-30 |
|  | $03-30=0: 50 \sim 32000 \mathrm{~Hz}$ |
|  |  |

Pulse input scaling, $100 \%=$ Maximum pulse frequency.

| 03-32 | Pulse input gain |
| :--- | :--- |
| Range | $0.0 \sim 1000.0 \%$ |

Target value (03-03) in \% = Pulse input frequency scaled to $100 \%$ based on maximum pulse frequency (03-31) times the gain (03-32) + bias (03-33).

| 03-33 | Pulse input bias |
| :---: | :--- |
| Range | $-100.0 \sim 100.0 \%$ |

Target value (03-03) in \% = Pulse input frequency scaled to $100 \%$ based on maximum pulse frequency (03-31) times the gain (03-32) + bias (03-33).

| 03-34 | Pulse input filter time |
| :---: | :--- |
| Range | $0.00 \sim 2.00 \mathrm{Sec}$ |

* Refer to section 3.9 control circuit terminals for details.
* Refer to figure 4.4.27 for the pulse input specification.

Figure 4.4.27 Pulse input adjustment

## Set Pulse Input Setup as Frequency Reference

Set parameter 00-05 to 4 and $03-30$ to 0 to use the pulse input terminal PI as the frequency reference source. Refer to Figure 4.3.5. for details. Next set the pulse input scaling (03-31), enter the pulse input frequency to match the maximum output frequency. Adjust the pulse input filter time in case interference or noise is encountered.

Example: Pulse train input maximum 10 kHz , set parameter $03-31$ to 10000 when maximum frequency is set to 60.0 Hz .

## Set Pulse Input as PID feedback value

Set parameter 00-05 to 5, 03-30 to 1 and PID feedback value source 10-01 to 3 , to use the pulse input terminal PI as the PID target (setpoint) value. Next set the pulse input scaling (03-31), enter the pulse input frequency to match the maximum output frequency. Adjust the pulse input filter time in case interference or noise is encountered. Refer to Figure 4.4.28.for details.

Note: The inverter will display a SE09 "PI setting error" when $03-30=1$ and $10-01$ is not set to 3 .

## Set Pulse Input as PID target value

Set parameter 00-05 to 5 and $03-30$ to 2 to use the pulse input terminal PI as the PID target (setpoint) value. Next set the pulse input scaling (03-31), enter the pulse input frequency to match the maximum output frequency. Adjust the pulse input filter time in case interference or noise is encountered. Refer to Figure 4.4.28.for details.

Note: The inverter will display a SE09 "PI setting error" if $03-30=0$ and PID control is enabled $(10-03>0)$.

Figure 4.4.28 PID control

| 03-35 | Function setting of pulse output |
| :--- | :--- |
|  | 1: Frequency command |
|  | 2: Output frequency |
| Range | 3: Output frequency after the soft start |
|  | 4: Motor speed |
|  | 5: PID feedback |
|  | 6: PID input |
|  | 7: PG output (with PG card) |

Refer to Table 4.4.10 for pulse output function selection overview.

| 03-36 | Scale of pulse output |
| :---: | :--- |
| Range | $1 \sim 32000 \mathrm{~Hz}$ |

Pulse output scaling, 100\% = Maximum pulse frequency (see table 4.4.10).
Note: When setting $03-35$ to 2 (output frequency) and setting $03-36$ to $0(0 \mathrm{~Hz})$, PO's pulse output and the inverter output frequency are sync.

Table 4.4.31 Pulse output function selection

| $\mathbf{0 3 - 3 5}$ | Function | Screen display (LCD) | Parameter | $\mathbf{1 0 0 \%}$ |
| :---: | :--- | :--- | :---: | :---: |
| $\mathbf{1}$ | Frequency command | Freq Ref | $12-16$ | $01-02$ |
| 2 | Output frequency (Fout) | Output Freq | $12-17$ | $01-02$ |
| 3 | Output frequency after soft-start | Output Freq (SFS) | - | $01-02$ |
| 4 | Motor speed (rpm) | Motor Speed | $12-22$ | $01-02$ |
| 5 | PID feedback | PID Feedback | $12-39$ | $01-02$ |
| 6 | PID input | PID Input | $12-36$ | $01-02$ |
| 7 | PG output | PG Pulse Output |  |  |

Note: Selection 1~4 are related to the motor speed, 5 and 6 are related to PID and 7 is related to PG.

## Setup the pulse output

Use 03-36 (pulse output scale) to set the pulse output frequency to $100 \%$ signal value of the selected item.
Please refer to the figure 4.4.29.

Figure 4.4.29 Pulse output proportion
When setting 03-35 to 2 (output frequency), PO's pulse output and the inverter output frequency are sync. Scale of pulse output is equal to the value of 03-36.

For the pulse output signal level, please refer to figure 4.4.30.

Figure 4.4.30 Pulse output signal level
When 03-35 = 7 (PG pulse monitoring output), PG pulse output scaling is internally set $1: 1$, independent of the scaling set in parameter 03-36.

Note: When pulse output function is active, it is required to use the external pull-up resistor at the terminal of PO (the upper limit current of PO is 50 mA and 48 V )

## Application examples

Example A: Speed follower from external PG
Use the pulse input signal as frequency reference or synchronization operation. Refer to Fig. 4.4.31.

Figure 4.4.31 Speed follower from external PG

## Parameter settings:

1. Frequency reference selection: $00-05=4$ (Pulse input)
2. Pulse input's function selection: $03-30=0$ (General pulse input)
3. Pulse input scale: 03-31 (set the number of pulse in Hz to match maximum output frequency, 01-02)
4. Pulse input gain: 03-32 (Set the input gain of the pulse frequency set by 03-31)
5. Pulse input bias: 03-33 (Set the input bias of the pulse frequency set by 03-31)
6. Pulse input's filter time: $03-34$ (if the pulse input is unstable due to the interference, increase value.)

Use the forward and reverse multi-function inputs to choose motor direction.
Note: For higher accuracy use PG feedback in SV or V/f+PG control mode.
Example B: Speed follower using two inverters

Figure 4.4.32 Speed follower using two inverters

## Inverter \#1 parameter settings: Frequency reference from PI signal (Master PG)

1. Frequency reference selection: $00-05=4$ (Pulse input)
2. Pulse input's function selection: $03-30=0$ (General pulse input)
3. Pulse input scale: 03-31 (set the number of pulse in Hz to match maximum output frequency, 01-02)
4. Pulse input gain: 03-32 (Set the input gain of the pulse frequency set by 03-31)
5. Pulse input bias: 03-33 (Set the input bias of the pulse frequency set by 03-31)
6. Pulse input's filter time: 03-34 (if the pulse input is unstable due to the interference, increase value.)
7. Pulse output function selection: 03-35=2 (Pulse output is output frequency
8. Scale pulse output parameter $03-36$ to $100 \%$ of output frequency

## Inverter \#1 parameter settings: Frequency reference from analog signal

1. Frequency reference selection: 00-05=1 (Analog input)
2. Pulse output function selection: 03-35=2 (Pulse output is output frequency
3. Scale pulse output parameter 03-36 to $100 \%$ of output frequency

## Inverter \#2: parameter settings:

1. Frequency reference selection: 00-05=4 (Pulse input)
2. Pulse input's function selection: $03-30=0$ (General pulse input)
3. Pulse input scale: 03-31 (set the number of pulse in Hz to match maximum output frequency, 01-02)
4. Pulse input gain: 03-32 (Set the input gain of the pulse frequency set by 03-31)
5. Pulse input bias: 03-33 (Set the input bias of the pulse frequency set by 03-31)
6. Pulse input's filter time: 03-34 (if the pulse input is unstable due to the interference, increase value.)

Note: When pulse output function is active, it is required to use the external pull-up resistor at the terminal of PO (the upper limit current of PO is 50 mA )

Example C: Synchronized operation using pulse input

(Synchronized Operation)
Figure 4.4.33: Synchronized operation of using pulse input

Connect pulse signal of an external pulse generator to the pulse input terminal PI of multiple follower inverters for output speed synchronization.

## Follow inverter \#1 and Follower \#2 parameter settings:

1. Frequency reference selection: 00-05=4 (Pulse input)
2. Pulse input's function selection: 03-30=0 (General pulse input)
3. Set one of the Multi-function inputs Sn : 03-00 ~ 03-07=32 (Synchronization command)

Example D: Synchronized operation of using pulse output master follower

(Synchronized Operation)
Figure 4.4.34 Synchronized operation master follower

## Master inverter parameter settings:

1. Pulse output function selection: $03-35=1$ (Pulse output is output frequency
2. Scale pulse output parameter $03-36$ to $100 \%$ of output frequency
3. Set one of the Multi-function inputs Sn : 03-00 ~ 03-07=32 (Synchronization command)

## Follower inverter parameter settings:

1. Frequency reference selection: 00-05=4 (Pulse input)
2. Pulse input's function selection: $03-30=0$ (Frequency command)
3. Pulse input scale: 03-31 (set the number of pulse in Hz to match maximum output frequency, 01-02)
4. Pulse input gain: 03-32 (Set the input gain of the pulse frequency set by $03-31$ )
5. Pulse input bias: 03-33 (Set the input bias of the pulse frequency set by 03-31)
6. Pulse input's filter time: $03-34$ (if the pulse input is unstable due to the interference, increase value.)
7. Set one of the Multi-function inputs Sn : 03-00 ~ 03-07=32 (Synchronization command)

| 03-37 | Timer ON delay (DI/DO) |
| :---: | :--- |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
|   <br> 03-38 Timer OFF delay (DI/DO) <br> Range $0.0 \sim 6000.0 \mathrm{Sec}$ |  |

Enable the timer function be setting one of multi-function input parameters 03-00~03-07 (S1 to S8) to 35 (timer function input) and one of multi-function output parameters 03-11, 03-12 (R1A-R1C to R4A- R4C and PH1 to PH4) to 27 (timer function output).

The timer function can be used to implement a timer relay. Use timing parameter 03-37 and 03-38 to set the timer ON / OFF delay.

Timer output is turned ON when the multi-function timer input is ON for the time specified in parameter 03-37.

Timer output is turned OFF after the multi-function timer input is turned OFF for the time specified in parameter 03-38.

## Timing example:

| $\mathbf{0 3 - 4 1}$ | Torque Detection Level |
| :---: | :--- |
| Range | $0 \sim 150 \%$ |
| $\mathbf{0 3 - 4 2}$ | Brake Release Delay Time |
| Range | $0.00 \sim 65.00 \mathrm{Sec}$ |

Brake Release Function :
It is required to be with the frequency agree function, as the following figure:
When the inverter starts running, if the output frequency >03-13, and both frequency detection level and output torque > torque detection level (03-41), it will delay the time of 03-42 to release brake.

It is recommended to be with starting and stopping frequency locked function (11-43~11-46), shown as the following figure:

| $03-43$ | UP／DOWN Acceleration／Deceleration Selection |
| :---: | :--- |
| Range | 【0】：Acceleration／Deceleration Time 1 |
|  | $【 1 】:$ Acceleration／Deceleration Time 2 |

Calculate the acceleration／deceleration time of frequency command by switch the function of UP／DOWN from parameter 03－43．Ex：$\Delta \mathrm{H} 1$（set frequency increment at acceleration）and $\Delta \mathrm{H} 2$（set frequency increment at deceleration）．

Refer to the followings for 04-00 Al input signal type:
(For standard U type)
If Al1 is $0 \sim 10 \mathrm{~V}$, set parameter $04-00$ to 0 or 1 .
If Al1 is $-10 \sim 10 \mathrm{~V}$, set parameter $04-00$ to 2 or 3 .
If AI2 is $0 \sim 10 \mathrm{~V}$, set parameter $04-00$ to 0 or 2 and tune SW2 on the control board to V . If AI2 is $4 \sim 20 \mathrm{~mA}$, set parameter $04-00$ to 1 or 3 , tune SW2 on the control board to I.
(For enhanced UE type)
If Al1 is $0 \sim 10 \mathrm{~V}$, set parameter $04-00$ to 0 or 1 , and tune SW3 on the control board to V.
If Al1 is $-10 \sim 10 \mathrm{~V}$, set parameter $04-00$ to 2 or 3 , and tune SW3 on the control board to V .
If Al1 is $4 \sim 20 \mathrm{~mA}$, set parameter $04-00$ to 4 or 5 , and tune SW3 on the control board to I.
If Al 2 is $0 \sim 10 \mathrm{~V}$, set parameter $04-00$ to 0 or 2 or 4 , and tune SW 4 on the control board to V .
If Al2 is $4 \sim 20 \mathrm{~mA}$, set parameter $04-00$ to 1 or 3 or 5 , tune SW4 on the control board to I.
(1) Analog Input Level Adjustment Al1, AI2 (04-02, 04-03, 04-04, 04-07, 04-08)

Each analog input Al1and AI2 has a separate gain and bias parameter associated with it.

Analog input signal Al1 can be adjusted with parameter 04-02 and 04-03; Analog input signal Al2 can be adjusted with parameter 04-07 and 04-08. Refer to Figure 4.4.35.

Figure 4.4.35 Analog inputs and related parameters (for Standard U type)
Gain setting: Sets the level in \% that corresponds to a $10 \mathrm{~V},-10 \mathrm{~V}$ or 20 mA signal at the analog input. (Set the maximum output frequency 01-02 to $100 \%$ )
Bias setting: Sets the level in \% that corresponds to a 0 V or 4 mA signal at the analog input.
(Set the maximum output frequency 01-02 to $100 \%$ )

Use both gain and bias setting to scale the input signal.

Figure 4.4.36 Gain and bias operations (for frequency reference signal)

## 04-04 (Al negative characteristics)

Through the following figure negative characteristics diagram find out the AI Input 10V, -10 V , or 20 mA input relative frequency reference to be used for the ratio of maximum output frequency (set the maximum output frequency $01-02$ to $100 \%$ ), the ratio will be presented in reverse.

(2) Al1 signal filtering time (04-01)
(3) AI2 signal filtering time (04-06)

All analog inputs (Al1, Al2) have a $1^{\text {st }}$ order programmable input filter that can be adjusted when noise is present on each of the incoming analog signal to prevent erratic drive control.

The filter time constant (range: 0.00 to 2.00 seconds) is defined as the time that the input step signal reaches $63 \%$ of its final value.

Note: Increasing the filter time causes the drive operation to become more stable but less responsive to change to the analog input.

Figure 4.4.37 Filter time constant

## (4) Al2 function setting (04-05)

AI2 is multi-function analog input terminal function selection. Refer to Table 4.4.11 for function overview.
Table 4.4.32 Multi-function analog input list (04-05 setting)

| Setting | Function |  | Description | Control mode |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 04-05=0: Auxiliary frequency

When parameter 00-05 = 1 (main frequency from external control) the auxiliary speed reference frequency can be activated via the multi-speed input commands (see table 4.4.7). The auxiliary frequency command can be set via AI2. The maximum output frequency is set by $01-02, \mathrm{Fmax}=100 \%$.

## 04-05=1: Frequency reference gain (FGAIN)

Multi-function analog input Al2 can be used to adjust the frequency reference gain of analog input Al1.
The total frequency reference gain of terminal Al1 is the internal gain set by parameter 04-02 times FGAIN.
The maximum frequency reference for Al1 is $100 \%$.

Figure 4.4.38 Frequency gain adjustment

## Example:

When the internal gain of AI1 (04-02) is set to $100 \%$ and Al 2 to 5 V (for example FGAIN $=50 \%$ ), the reference frequency of terminal Al1 will be $50 \%$, as shown in Figure 4.4.39.

Figure 4.4.39 Frequency reference gain adjustment (example)

04-05=2: Frequency reference bias (FBIAS)
Multi-function analog input terminal AI2 can be used to adjust the frequency reference bias of Al1.
The total frequency reference bias of terminal Al1 is the sum of internal bias set by parameter 04-03 and FBIAS.
The maximum frequency reference for Al1 is $100 \%$.

Figure 4.4.40 Bias adjustment

## Example:

Terminal Al1 input is $0 \mathrm{~V}, 04-02=100 \%$ (Al1 gain), $04-03=0 \%$ (Al1 bias) and terminal Al2 input is 3 V . The reference frequency will be $30 \%$ as shown in Figure 4.4.41.

Figure 4.4.41 Frequency Reference bias adjustment (example)

04-05=3: Output voltage bias (VBIAS)
Multi-function analog input Al2 can be used to adjust the output voltage. The total output voltage of inverter is the sum of output voltage based on the selected V/F curve and VBIAS.
The maximum output voltage is set by $01-03, \mathrm{Vmax}=100 \%$.

Figure 4.4.42 Bias adjustment
04-05=4: Acceleration and deceleration coefficient (K)
Multi-function analog input Al2 can be used to adjust the acceleration and deceleration time coefficient. The actual acceleration and deceleration time is calculated as follows:

Acceleration / Deceleration time (00-14 ~ 00-17, 00-21, 00-24)
Actual accel /decel time = $\square$
Acceleration/ Deceleration time setting is $100 \%$ (00-14~00-17, 00-21~00-24).

Figure 4.4.43 Acceleration / deceleration time reduction coefficient
04-05=5: DC braking current
Multi-function analog input AI2 can be used to adjust the DC Injection braking current.
DC braking current parameter 07-07 setting should be set to $0 \%$ to use this function.
The inverter rated current $=100 \%$

Figure 4.4.44 DC braking current adjustment

04-05=6: Over-torque detection level
Multi-function analog input AI2 can be used to adjust the over-torque detection level.
$100 \%$ of inverter rated current (V/F or V/F + PG control mode)
$100 \%$ motor rated torque (SLV or SV control mode)
If the multi-function analog input is used to adjust the over-torque level, the internal over-torque detection level (08-15) is disabled.

Figure 4.4.45 Over-torque detection level adjustment

4-05=7: Stall prevention level during running
Multi-function analog input Al2 can be used to adjust the stall prevention level during operation.
Inverter rated current $=100 \%$. When Al2 is set to control stall prevention level $(04-05=7)$ and parameter 08-03 (Stall prevention level during operation) is used, then the lesser of the two value becomes the active stall prevention level during operation.

Example: If the motor power is less than that of the inverter, the operation and the stall prevention of the motor will be based on the factory settings, multi-function analog input AI2 can be used to reduce the stall prevention level during operation.

Figure 4.4.46 Stall prevention level adjustment in operation

04-05=8: Frequency lower limit
Multi-function analog input AI2 can be used to adjust the lower limit of frequency reference.
Maximum output frequency ( $F m a x, 01-02$ ) $=100 \%$. The actual lower limit is determined by the maximum value of 00-13 (frequency lower limit) and level of the multi-function analog input AI2.

Figure 4.4.47 Adjustment of lower limit of frequency reference

04-05=9: Jump frequency 4
Multi-function analog input Al2 can be used to adjust Jump frequency 4.
Maximum output frequency $(01-02, F m a x)=100 \%$. Setting $11-08$ to $11-10$ to 0.0 Hz turns of the Jump frequency function.

Figure 4.4.48 Jump frequency 4 Setting Operation

## 04-05=10: Added to Al1

Multi-function analog input Al2 can be used as a bias level for analog input Al1.

Figure 4.4.49 Operation of being added to Al1 as bias

## Example:

$04-02(\mathrm{Al} 1$ gain $)=100 \%, 04-03(\mathrm{Al} 2$ gain $)=0 \%$, and terminal Al 2 level is 2 V . If input terminal Al 1 is 0 V , the internal reference frequency of terminal Al1 will be $20 \%$.

## $04-05=11$ : Positive torque limit

Multi-function analog input Al2 can be used to adjust the positive torque limit.
$04-05=12$ : Negative torque limit
Multi-function analog input A12 can be used to adjust the negative torque limit.
04-05=13: Regenerative torque limit
Multi-function analog input AI2 can be used to adjust the regenerative torque limit.
04-05=14: Positive / negative torque limits
Multi-function analog input AI2 can be used to adjust both the positive and negative torque limit.
For more details on torque limits, please refer to parameter group 21 - torque and position control group.
$\mathbf{0 4 - 0 5}=\mathbf{1 5}$ : Torque reference / torque limit of speed control
Multi-function analog input AI2 can be used to adjust the torque reference / torque limit in closed loop vector mode.

04-05=16: Torque reference/ Torque compensation of speed control
Multi-function analog input AI2 can be used to adjust the torque reference / torque compensation in closed loop vector mode.

For more details on the torque control functions, please refer to parameter group 21 - torque and position control group.

## 04-05=17: PTC Overheat Protection

Use the sensor in the motor to stop from overheats. Please refer to 08-42~08-44 description for more details.

Figure 4.4.50 Analog outputs and related parameters

## Analog output AO1 and AO2 adjustment (04-12, 04-13 and 04-17, 04-18)

Signal: Use parameter 04-11 to select the analog output signal for AO1 and parameter 04-16 to select the analog output signal for AO2.

Gain: Use parameter 04-12 to adjust the gain for AO1 and parameter 04-17 to adjust the gain for AO2.
Adjust the gain so that the analog output (10V/20mA) matches $100 \%$ of the selected analog output signal (04-11 for AO1 and 04-16 for AO2).

Bias: Use parameter 04-13 to adjust the bias for AO1 and parameter 04-18 to adjust the bias for AO2.
Adjust the bias so that the analog output ( $0 \mathrm{~V} / 4 \mathrm{~mA}$ ) matches $0 \%$ of the selected analog output signal (04-11 for AO1 and 04-16 for AO2).

Figure 4.4.51 Analog output level adjustment

## Analog output terminal function selection (04-11 and 04-16)

Refer to the following table 4.4.33.

Table 4．4．33 Selection of analog output terminals function（04－11 and 04－16）

| $04-19$ | AO output signal type |  |  |  |
| :---: | :--- | :--- | :--- | :--- |
| Range | $【 0 】: A O 1$ | $0 \sim 10 \mathrm{~V} ;$ AO2 | $0 \sim 10 \mathrm{~V}$ |  |
|  | $【 1 】: A O 1$ | $0 \sim 10 \mathrm{~V} ;$ AO2 | $4 \sim 20 \mathrm{~mA}$ |  |
|  | $【 2 】: A O 1$ | $4 \sim 20 \mathrm{~mA}$ ；AO2 | $0 \sim 10 \mathrm{~V}$ | （For UE type） |
|  | $【 3 】: A O 1$ | $4 \sim 20 \mathrm{~mA}$ ；AO2 | $4 \sim 20 \mathrm{~mA}$ | （For UE type） |

－For standard U type：
It is required to be with the setting of SW6 on the conrtol board when AO2 analog output signal is active．
When $04-19=0$（AO2 is $0 \sim 10 \mathrm{~V}$ ）and SW6 on the control board is V ，AO2 output signal type is voltage．
When $04-19=1$（AO2 is $4 \sim 20 \mathrm{~mA}$ and SW6 on the control board is I ，AO2 output signal type is current．
－For UE type：
It is required to be with the setting of SW1 and SW2 on the control board when AO1 and AO2 analog output signals are active．
When $04-19=0$ ， AO 1 is $0 \sim 10 \mathrm{~V}$ ，and SW 1 on the control board is V ，AO1 output signal type is voltage．
AO2 is $0 \sim 10 \mathrm{~V}$ ，and SW2 on the control board is V ，AO2 output signal type is voltage．
When $04-19=1, \mathrm{AO} 1$ is $0 \sim 10 \mathrm{~V}$, and SW 1 on the control board is V , AO 1 output signal type is voltage.
AO2 is $4 \sim 20 \mathrm{~mA}$, and SW2 on the control board is $\mathrm{I}, \mathrm{AO} 2$ output signal type is current.
When $04-19=2$, AO1 is $4 \sim 20 \mathrm{~mA}$, and SW1 on the control board is I, AO1 output signal type is current.
AO 2 is $0 \sim 10 \mathrm{~V}$, and SW 2 on the control board is $\mathrm{V}, \mathrm{AO} 2$ output signal type is voltage.
When $04-19=3$, AO1 is $4 \sim 20 \mathrm{~mA}$, and SW1 on the control board is I , AO1 output signal type is current.
AO2 is $4 \sim 20 \mathrm{~mA}$, and SW2 on the control board is I, AO2 output signal type is current.

| $04-20$ | Filter time of AO signal scan |
| :---: | :--- |
| Range | $【 0.00 \sim 0.50 】$ Sec |

Setting of parameter $04-20$ is used for filtering momentary change in analog output signal. When it is enabled, system response will lower down and interference protection will enhance.

## 05- Multi-Speed Parameters

| $\mathbf{0 5 - 0 0}$ | Acceleration and deceleration selection of multi-speed |
| :---: | :--- |
| Range | 0: Acceleration and deceleration time $1 \sim 4$ used. <br> 1: Use independent acceleration and deceleration time for each multi-speed setting. |

05-00=0: Standard Acceleration and deceleration times parameters 00-14~00-17 / 00-21 ~ 00-24 are used for multi-speed $0 \sim 15$.

05-00=1: Each multi-speed uses a dedicated acceleration and deceleration time parameters 05-17 ~ 05-48. There are two different modes for acceleration / deceleration timing when 05-00 is set to 1 , see time example on the next page.

## Acceleration time calculation formula

> Acceleration time x (set frequency - output frequency)

Time it takes to reach set frequency $=$
Maximum output frequency

## Deceleration time calculation formula

Deceleration time $\times$ (output frequency - set frequency)
Time it takes to reach set frequency = Maximum output frequency

Maximum output frequency: Parameter 01-00=F, maximum output frequency set by 01-02, 01-00 $\neq \mathrm{F}$, maximum output frequency determined by V/F curve selected (50.0 / 60.0 / 90.0 / 120.0 / 180.0).

Example: $01-00=01$ ( 50 Hz (maximum output frequency), $05-02=10 \mathrm{~Hz}$ (multi-step speed 0 ), 05-17=5.0s (Acceleration time), 05-18=20.0 sec. (Deceleration time).

## Acceleration time calculation formula

$5.0 \times 10 \mathrm{~Hz}$
Time it takes to reach set frequency $=\quad=1.0 \mathrm{sec}$.
50 Hz

## Deceleration time calculation formula

$20.0 \times 10 \mathrm{~Hz}$
Time it takes to reach set frequency $=\quad=4.0 \mathrm{sec}$.
50 Hz

Example: Acceleration / deceleration timing when $05-00$ is set to 1 . In this example the following parameters are set:

00-02=1 (External terminal operation)
03-00=0 (Terminal S1: Forward /Stop)
03-01=1 (Terminal S2: Reversal /Stop)
03-02=2 (Terminal S3: Speed 1)
03-03=3 (Terminal S4: Speed 2)
03-03=4 (Terminal S5: Speed 3)
*Speed 1 is required to confirm if Al2 function setting (04-05) is set to 0 (Auxiliary frequency). If $04-05=0$, it will make the frequency of speed 1 set to $\mathrm{Al2}$ auxiliary frequency and the value is determined by AI2. If function of speed 1 is generally used, set Al2 to other functions except 0 (the recommended value: set 10 ADD to AI1.)

## Acceleration / Deceleration Calculation Mode 1:

If the run command is cycled on and off, acceleration and deceleration time $(a \sim f)$ is calculated based on the active speed command as follows:

|  | Off |  |
| :---: | :---: | :---: |
|  |  |  |
| Terminal S2 |  |  |
| Terminal S3 | Off | On |
| Terminal S4 |  |  |

$$
\begin{array}{lll}
a=\frac{(05-17) \times(05-01)}{(01-02)} & b=\frac{(05-18) \times(05-01)}{(01-02)} & c=\frac{(05-19) \times(05-02)}{(01-02)} \quad \text { in sec. } \\
d=\frac{(05-20) \times(05-02)}{(01-02)} & e=\frac{(05-21) \times(05-03)}{(01-02)} & f=\frac{(05-22) \times(05-03)}{(01-02)}
\end{array} \quad \text { in sec. }
$$

## Acceleration / Deceleration Calculation Mode 2:

If the run command is remains on, acceleration and deceleration time $(a \sim f)$ is calculated based on the active speed command as follows:

| 05-01 | Frequency setting of speed-stage 0 |
| :---: | :---: |
| Range | $0.0 \sim 599.00 \mathrm{~Hz}$ |
|  |  |
| 05-17 | Acceleration time setting for multi speed 0 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-18 | Deceleration time setting for multi speed 0 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
|  |  |
| 05-19 | Acceleration time setting for multi speed 1 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-20 | Deceleration time setting for multi speed 1 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-21 | Acceleration time setting for multi speed 2 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-22 | Deceleration time setting for multi speed 2 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-23 | Acceleration time setting for multi speed 3 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-24 | Deceleration time setting for multi speed 3 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-25 | Acceleration time setting for multi speed 4 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
|  |  |
| 05-26 | Deceleration time setting for multi speed 4 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
|  |  |
| 05-27 | Acceleration time setting for multi speed 5 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-28 | Deceleration time setting for multi speed 5 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
|  |  |
| 05-29 | Acceleration time setting for multi speed 6 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
|  |  |
| 05-30 | Deceleration time setting for multi speed 6 |
| Range | 0.0~6000.0 Sec |
|  |  |
| 05-31 | Acceleration time setting for multi speed 7 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |

| 05-32 | Deceleration time setting for multi speed 7 |
| :---: | :---: |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
| 05-33 | Acceleration time setting for multi speed 8 |
| Range | 0.0~6000.0 Sec |
| 05-34 | Deceleration time setting for multi speed 8 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
| 05-35 | Acceleration time setting for multi speed 9 |
| Range | 0.0~6000.0 Sec |
| 05-36 | Deceleration time setting for multi speed 9 |
| Range | 0.0~6000.0 Sec |
| 05-37 | Acceleration time setting for multi speed 10 |
| Range | 0.0~6000.0 Sec |
| 05-38 | Deceleration time setting for multi speed 10 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
| 05-39 | Acceleration time setting for multi speed 11 |
| Range | 0.0~6000.0 Sec |
| 05-40 | Deceleration time setting for multi speed 11 |
| Range | 0.0~6000.0 Sec |
| 05-41 | Acceleration time setting for multi speed 12 |
| Range | 0.0~6000.0 Sec |
| 05-42 | Deceleration time setting for multi speed 12 |
| Range | 0.0~6000.0 Sec |
| 05-43 | Acceleration time setting for multi speed 13 |
| Range | 0.0~6000.0 Sec |
| 05-44 | Deceleration time setting for multi speed 13 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
| 05-45 | Acceleration time setting for multi speed 14 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
| 05-46 | Deceleration time setting for multi speed 14 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |
| 05-47 | Acceleration time setting for multi speed 15 |
| Range | 0.0~6000.0 Sec |
| 05-48 | Deceleration time setting for multi speed 15 |
| Range | $0.0 \sim 6000.0 \mathrm{Sec}$ |

| $\mathbf{0 6 - 0 0}$ | Automatic operation mode selection |
| :---: | :--- |
|  | 0: Disable <br> 1: Execute a single cycle operation. Restart speed is based on the previous stopped speed. <br> Range <br>  <br> 2: Execute continuous cycle operation. Restart speed is based on the previous cycle stop speed. <br> 3: After completion of a single cycle, the on-going operation speed is based on the speed of the <br> last stage. Restart speed is based on the previous stopped speed <br> 4: Execute a single cycle operation. Restart speed is based on the Speed-Stage 0. <br> 5: Execute continuous cycle operation. Restart speed is based on the Speed-Stage 0. <br> 6: After completion of a single cycle, the on-going operation speed is based on the speed of the <br> last stage. Restart speed is based on the Speed-Stage 0 0 |

Automatic operation mode uses frequency reference parameters 05-01, 06-01~06-15, operation time parameters 06-16 ~ 06-31 and direction of operation parameters 06-32~06-47.

## Notes:

The automatic operation mode is disabled when any of the following functions are active:

- Frequency wobbling function
- PID function

When automatic operation mode is active, external multi-step speed reference command $1 \sim 4$ (03-00~03-07=2~5) is disabled.

Example 1: Automatic operation mode - Single cycle
In this example the inverter executes a single cycle and then stops.

## Parameter Settings:

| 06-00 = | 1 or 4 (Single cycle operation) |
| :---: | :---: |
| 06-32~06-34= | 1 (Forward for multi-step speed 0-2) |
| 06-47= | 2 (Reverse for multi-step speed 15) |
| 06-35~06-46= | 0 (Stop for multi-step speed 3-14) |
| 05-01= | 15 Hz (Multi-step speed 0: 15 Hz ) |
| 06-01= | 30 Hz (Multi-step speed 1:30 Hz) |
| 06-02= | 50 Hz (Multi-step speed 2: 50 Hz ) |
| 06-15= | 20 Hz (Multi-step speed 15: 20 Hz ) |
| 06-16= | 20 sec (Multi-step time 0: 20 sec ) |
| 06-17= | 25 sec (Multi-step time 1: 25 sec ) |
| 06-18= | 30 sec (Multi-step time 2: 30 sec ) |
| 06-31= | 40 sec (Multi-step time 15: 40 sec ) |

Figure 4.4.52 Single cycle automatic operation (stop)

Example 2: Automatic operation mode - Continuous cycle
In this example the inverter repeats the same cycle.

## Parameter Settings:

06-00 = $\quad 2$ or 5 (Continuous cycle operation)
06-01~06-47= Enter the same setting as that of Example 1.

Figure 4.4.53 Periodic automatic operation

Example 3: Automatic operation mode - Single cycle and continue running at last speed of the cycle In this example the inverter executes a single cycle and continue running at last speed of the cycle.

## Parameter Settings:

$\begin{array}{ll}06-00= & 3 \text { or } 6 \text { (Single cycle operation) } \\ 06-32 \sim 06-35= & 1 \text { (Forward) } \\ 06-36 \sim 06-47= & 0 \\ \text { Other parameter }= & \text { Enter same setting as that of Example 1. }\end{array}$

Figure 4.4.54 Single cycle automatic operation (continuous)
$06-00=1$ to $3:$
After a stop the inverter will restart with the incomplete step when the run command is re-applied.
$06-00=4$ to 6 :
After a stop the inverter will restart with the first step of the cycle when the run command is re-applied.

## Notes:

- Acceleration/ deceleration time is set with the setting of 00-14 and 00-15 in the automatic operation mode.
- If the setting value of parameters $06-16 \sim 06-31$ is 0 , automatic operation mode is not active.

## 07- Start/Stop Parameters

| $07-00$ | Momentary Power Loss/Fault Restart Selection |
| :---: | :--- |
| Range | $0:$ Disable <br> $1:$ Enable |

$\mathbf{0 7 - 0 0}=0$ : Inverter trips on "UV" fault if power loss time is greater than 8 ms .
$\mathbf{0 7 - 0 0}=\mathbf{1}$ : Inverter restarts after restarting the power at the momentary power loss.
Note: When $07-00=1$, inverter restore automatically the motor rotation after restarting the power even if momentary power loss occurs.

| 07-01 | Fault reset time |
| :---: | :--- |
| Range | $0 \sim 7200 \mathrm{Sec}$ |

Restart time of momentary power loss is the same as Fault reset time.
07-01 <07-18: Automatic restart time interval is set by minimum baseblock time (07-18).
$07-01>07-18:$ Automatic restart time interval is set by fault reset time (07-01).
Note:
Automatic restart time interval is time of 07-18 plus 07-01 and delay time of peed search (07-22).
Refer to Figure 4.4.55 for automatic restart interval.

Figure 4.4.55 Automatic restart interval

| 07-02 | Number of restart attempts |
| :--- | :--- |
| Range | $0 \sim 10$ |

If numbers of fault reset reaches the setting value of 07-02, then inverter stops running. So manual to restart the inverter after eliminating fault causes.

When the automatic restart function is enabled the internal automatic restart attempt counter is reset based on the following actions:
a) No fault occurs in 10 minutes or longer after the automatic restart
b) Reset command to clear fault via input terminal or using the keypad (ex: press reset/ $\boldsymbol{4}$ key)
c) Power to the inverter is turned off and back on again

## Note:

Multi-function digital output R1A-R1C, R2A-R2C, or optocoupler output can be programmed to activate during an automatic reset attempt, refer to parameter 03-11, 03-12 and 03-28.

## Automatic restart operation:

a) Fault is detected. The inverter turn off the output, displays the fault on the keypad and waits for the minimum baseblock time parameter 07-18 to expire before accepting another run / automatic restart command.
b) After the minimum baseblock time (07-18) and delay time of speed search have expired, the active fault is reset and a speed search operation is performed. The time between each fault restart attempt is set by parameter 07-01.
c) When the total number of restart attempts exceed the number of automatic restart attempts set in parameter 07-02, the inverter will turn off the output and the fault contact is activated.

Please refer to Figure 4.4.56 for the automatic restart operation.

Figure 4.4.56 Auto-restart operation.

The automatic restart function is active for the following faults. Please note that when the fault is not listed in the table the inverter will not attempt an automatic restart.

| Parameter Name | Faults |  | Numbers of Restart |
| :---: | :---: | :---: | :---: |
| 07-00 | UV (under voltage) |  | Unlimited |
| 07-01 <br> 07-02 | OC (over current) <br> OCA (over current in ACC.) <br> OCC (over current in constant speed) <br> OCd (over current in DEC) <br> OL1 (motor overload) <br> UT (Under torque detection) <br> IPL (input phase loss) | GF (ground failure) OV (overvoltage) OL2 (Inverter overload) OT (Over-torque detection) OPL (Output phase loss) CF07 (SLV motor control setting fault) <br> CF08 (PMSLV motor control setting fault) | Depend on parameter 07-02 |

## Notes:

1. Fault restart function contains momentary power loss restart and auto reset restart.
2. Refer to chapter 10 for the details of troubleshooting and fault diagnostics.
3. Refer to speed search function (07-19~07-24) for the selection of speed search modes.

Note:
Automatic restart function is only active in the state of no harm to the safety or to the application devices.

## Warning - Excessively use of the automatic restart function will damage the inverter.

| $\mathbf{0 7 - 0 4}$ | Direct Start at Power on |
| :---: | :--- |
| Range | 【0】：When the external run command is enabled，direct start at power up |
|  | 【1】：When the external run command is enabled，unable to direct start at power－up． |

## 07－04＝0，

If operation switch is conducted at power up，the inverter will start automatically．
07－04＝1，
If operation switch is not conducted at power up，the inverter is not able to start and the warning signal of STP1 flashes．It is required to turn off the operation switch first，and then make it be conducted to start the inverter．

| $\mathbf{0 7 - 0 5}$ | Delay of Direct Start at Power on |
| :--- | :--- |
| Range | $【 1.0 \sim 300.0 】$ Sec |

If $07-04=0$ ，it will count the delay time set by $07-05$ first when the inverter starts directly at power on．When the delay time is completed，it starts to run．

## ！DANGER：

＞When 07－04＝【0】 and the external run is set（00－02／00－03＝1），
If the operation switch is conducted at power up，the inverter starts automatically．It is suggested to turn off the power switch and operation switch at power failure to avoid the damage to the user or the machine when the inverter reconnects．
＞When 07－04＝【1】 and the external run is set（00－02／00－03＝1），
If the operation switch is not conducted at power up，the inverter is not able to start and the warning signal ofSTP1 falshes．It is required to turn off the operation switch first and the delay time of direct start at power up is completed．Then make it be conducted to start th inverter．

| $\mathbf{0 7 - 0 6}$ | DC injection braking starting frequency |
| :---: | :--- |
| Range | $0.0 \sim 10.0 \mathrm{~Hz}$ |

The braking act according to the different control modes，please refer to the following descriptions：
1．Control mode：VF，VF＋PG，SLV and SLV2 $(00-00=0, ~ 1, ~ 2, ~ 6)$
It starts DC injection braking by the time 07－16．Deceleration to stop is according to 07－06 and 07－08．When output frequency is lower than 07－06 in deceleration time，it starts DC injection braking by the time 07－08．

Figure 4．4．57a VF，VF＋PG，SLV and SLV2 DC injection braking
Note：When 07－06＜01－08，it starts DC injection braking by the setting frequency（01－08）
2.Control mode: PMSLV (00-00=5)

Set short-circuit braking time at start and DC braking time at start individually by parameter 07-34 and 07-16. Braking action at start is active to perform SC braking by the set time of 07-34 and then to perform DC braking by that of 07-16. When deceleration to stop, set short-circuit braking time at stop and DC braking time at stop individually by parameter 07-35 and 07-08. When the output frequency falls below 07-06 at deceleration, perform short-circuit braking by the set time of 07-35 and then perform DC braking by the set time of 07-08. Refer to Fig. 4.4.57b for the braking action.

Note:

1. If $07-06<01-08$, braking action is active by the set frequency of 01-08.
2. DC braking current level at start or stop is set by $07-07$ on the base of inverter rated current being $100 \%$.
3. If DC braking current level set by $07-07$ is higher than the motor rated current, DC braking current level is limited to the motor rated value.
4. SC braking current level at start or stop is set by $07-36$ on the base of motor rated current being $100 \%$.

Figure 4.4.57b PMSLV short-circuit braking
Note: When 07-06 < 01-08, it starts short-circuit braking by the setting frequency (01-08)
3. Control mode: SV and $\operatorname{PMSV}(00-00=3, ~ 4)$

It starts zero-speed operation by the time 07-16. Deceleration to stop is according to 07-06 and 07-08. When output frequency is lower than 07-06 in deceleration time, it starts zero-speed operation by the time 07-08.

Output

Figure 4.4.57c SV and PMSV zero-speed operation
Note: When 07-06 < 01-08, it starts zero-speed operation by the setting frequency (01-08)

| 07-07 | DC injection braking current |
| :--- | :--- |
| Range | $0 \sim 100 \%$ |

DC Injection braking current as percentage of the inverter rated current. Increasing this level will increase the amount of heat generated by the motor windings. Do not set this parameter higher than the level necessary to hold the motor shaft.

| 07-08 | DC injection braking time at stop |
| :--- | :--- |
| Range | $0.00 \sim 10.00 \mathrm{Sec}$ |

Duration of DC injection braking during a stop operation. DC injection braking at stop is disabled when parameter $07-08$ is set to 0 sec .

| $\mathbf{0 7 - 1 6}$ | DC injection braking time at start |
| :---: | :--- |
| Range | $0.00 \sim 10.00 \mathrm{Sec}$ |

Duration of DC injection braking is during a start operation. DC injection braking at start is disabled when parameter $07-16$ is set to 0 sec.

## DC Injection Braking Operation

When DC Injection braking is active DC voltage is applied to the motor, increasing the braking current and resulting in an increase in the strength of the magnetic field trying to lock the motor shaft.

To enable DC injection braking during a start operation set the DC injection braking current (07-07) and the DC injection braking time (07-16) at start to a value greater than 0 . DC injection braking at start can be used to prevent "wind milling effect" in fan applications.

To enable DC injection braking during a stop operation set the DC injection braking current (07-07) and the DC injection braking time at stop (07-08) to a value greater than 0 .

## Notes:

- When parameter 07-16 is set to 0 sec (DC injection braking off). the inverter will start from the minimum output frequency.
- Increasing the DC braking time (07-08, 07-16) can reduce the motor stop time.
- Increasing the DC braking current (07-07) can reduce the motor stop time.
- During stop operation: If the DC braking start frequency < minimum output frequency (01-08), DC braking is activated when the output frequency reaches the minimum output frequency level.
- DC Injection braking cannot be used in sensor vector control (SV).

For DC braking operation, please refer to Figure 4.4.57.

Figure 4．4．58 DC braking operation

DC braking operation can be controlled via any one of the multi－function input terminals（ $03-00$ to 07 ）function 33 ． Refer to figure 4．4．58 for DC braking operation．

DC braking current can be controlled via the multi－function analog input（04－05）function 5．Refer to Figure 4．4．44．

| $\mathbf{0 7} \mathbf{3 4}$ | Start short－circuit braking time |
| :--- | :--- |
| Range | 【0．00～100．00】 Sec |
| $\mathbf{0 7 - 3 5}$ | Stop Short－circuit braking time |
| Range | 【0．00～100．00】 Sec |
| $\mathbf{0 7 - 3 6}$ | Short－circuit braking current limited |
| Range | 【0．0～200．0】\％ |

PMSLV is available for short－circuit braking．Short－circuit braking is the way to switch IGBT to produce braking torque．07－06，07－34 and 07－36 can adjust the braking process．

If $07-35=0$ ，Inverter start from the minimum frequency．
The value of $07-36$ is depend on differential motor rated current．（exe motor rated current is $5 \mathrm{~A}, 07-36=100 \%$ is 5A）

03－00～03－07＝65 can control Short－circuit braking．

| $\mathbf{0 7 - 0 9}$ | Stop mode selection |
| :---: | :--- |
| Range | 0：Deceleration to stop |
|  | 1：Coast to stop |
|  | 2：DC braking to stop |
|  | 3：Coast to stop with timer |

When a stop command is issued the inverter stops according to the stop mode selected．There are four types of stop modes，

Note: DC braking stop (2) and coast to stop with timer (2) are not available in SV mode.
07-09=0: Deceleration to stop

When a stop command is issued, the motor will decelerate to the minimum output frequency (01-08) Fmin and then stop. Deceleration rate depends on the deceleration time (factory default: 00-15).

When the output frequency reaches the DC braking stop frequency (07-06) or the minimum output frequency (01-08), DC injection braking is activated and the motor stops.

Output frequency when stop command is issued
Deceleration time $=$

$$
\text { Maximum output frequency } F_{\max }(01-02) \times \text { deceleration time setting }
$$

Note: S curve setting will add to the overall stop time

T: DC Braking Time at stop (07-08)
Figure 4.4.59 Deceleration to stop

## 07-09=1: Coast to stop

When a stop command is issued, the motor will coast to a stop. Stop time depends on motor load and friction of the system.

The inverter waits for the time set in the minimum baseblock time (07-18) before accepting the next run command.

In SLV mode (00-00=2) the speed search function is automatically enabled upon the next run command.
Note: When using a mechanical brake set parameter 07-26 to 1 (Software version 1.3 or later).

Figure 4.4.60 Coast to stop
07-09=2: DC braking to stop
When a stop command is issued, the inverter will turn off the output (Baseblock) and after the minimum Baseblock time (07-18) has expired activate DC braking (07-07). Refer to Figure 4.4.61.

The DC braking time (tDCDB) of Figure 4.4.61 is determined by the value of $07-08$ (DC Braking start time) and the output frequency at the time the stop command was issued.
tocdi $=\frac{(07-08) \times 10 \times \text { output frequency }}{\operatorname{Fmax}(01-02)}$

Note: Increase the minimum Baseblock time (07-18) in case an Overcurrent trip occurs during the DC braking.

tb.b :Minimum baseblock time (07-18) tocDe :DC braking time

Figure 4.4.61 DC braking to stop

07-09=3: Coast to stop with timer
When a stop command is issued the motor will coast to a stop after the minimum Baseblock time (07-18) has expired. The inverter ignores the run command until the total time of the timer has expired.

The total time of the timer is determined by the deceleration time (00-15, 17, 22 or 24 ) and the output frequency upon stop. Refer to Figure 4.4.62

Figure 4.4.62 Coast to stop with timer

| $\mathbf{0 7 - 1 3}$ | Low voltage detection level |
| :--- | :--- |
|  | $200 \mathrm{~V}: 150 \sim 210 \mathrm{Vdc}$ |
| Range | $400 \mathrm{~V}: 300 \sim 420 \mathrm{Vdc}$ |
|  | $575 \mathrm{~V}: 500 \sim 600 \mathrm{Vdc}$ |
|  | $690 \mathrm{~V}: 500 \sim 600 \mathrm{Vdc}$ |

| $07-25$ | Low voltage detection time |
| :---: | :--- |
| Range | $0.00 \sim 1.00 \mathrm{Sec}$ |

Adjust the 07-13 voltage level from 150 to 300 Vdc (200V class) or from 250 to 600 Vdc (400V class).

When the AC input voltage is lower than the 07-13 value (07-13/ $1.414=A C$ voltage detection level) for the time specified in 07-25 the low-voltage error "UV" will displayed. If $07-25=0.00 \mathrm{sec}$., the UV error will be displayed immediately.

Set preventive measures:

- The inverter input voltage will limit the output voltage. If the input voltage drops excessively, or if the load is too big, the motor may stall.
- If the input voltage drops below the value set in 07-13 then the output is turned off momentarily. The inverter will not automatically start when power is restored.

| $07-14$ | Pre-excitation time |
| :---: | :--- |
| Range | $0.00 \sim 10.00 \mathrm{Sec}$ |

| $07-15$ | Pre-excitation level |
| :---: | :--- |
| Range | $100 \sim 200 \%$ |

If a high starting torque is required for the application, especially for a large horsepower motors, the pre-excitation operation can be used to pre-flux (magnetize) the motor.

## Pre-excitation time (07-14)

When an operation command (forward or reverse) is activated, the inverter will automatically start pre-excitation based on the time set in parameter 07-14.

The time for the flux to reach $100 \%$ is a function value of motor's electrical time constant (See figure 4.4.63).

Electrical time constant (quadratic by-pass circuit time constant) can be calculated by motor parameter setting (group 02)

Electrical time constant $\mathrm{T} 2=\quad$ Motor leakage inductance $(02-17)+$ motor mutual inductance (02-18)
Motor rotor resistance (02-16)

Set the pre-excitation time (07-14) based on the electrical time constant T2

## Pre-excitation initial level (07-15)

Use the pre-excitation initial level (07-15) to provide a higher excitation current during the pre-excitation time (07-14), which will increase the speed and stability for motors.

In order to quickly magnetize the motor, reduce the pre-excitation time (07-14) and set the pre-excitation level
(07-15) to a high level.

If $07-15$ is set greater than $100 \%$, providing a high excitation current during the pre-excitation time (07-14), motor's magnetization time is shorted. When the setting reaches $200 \%$, magnetization is reduced by roughly half.

A high pre-excitation level (07-15) might result in excessive motor sound during pre-excitation.

When the flux reaches $100 \%$, pre-excitation current reverts back to $100 \%$ and pre-excitation is completed.

Figure 4.4.63 Pre-excitation operation

| $07-18$ | Minimum base block time |
| :--- | :--- |
| Range | $0.1 \sim 5.0 \mathrm{Sec}$ |

In case of a momentary power failure, the inverter continues to operate after the power has been restored when parameter 07-00 is set to 1 . Once the momentary power failure is detected; the inverter will automatically shut down the output and maintain B.B for a set time (07-18).

It is expected that after the minimum base block time has expired the residual voltage to be almost zero.

When the momentary power failure time exceeds the minimum base block time (07-18), the inverter will automatically perform a speed search upon return of power. Refer to the following figure 4.4.64.

Figure 4.4.64 Minimum B.B time and momentary power loss time
Minimum base block time (07-18) is also used to for the DC braking function in combination with speed search as follows:

- Set the minimum base block time required (07-18).
- Execute speed search or DC braking function.
- Increase minimum Baseblock time if over-current "OC" condition occurs.
- After speed search is completed, normal operation continues.

| :---: | :--- |
| Range | 0: Maximum Output Frequency of Motor <br> 1: Frequency Command |

Speed search function is used to find the speed of a coasting motor and continue operation from that point. The speed search function is active after a momentary power loss. In V / F + PG or SV control mode (with PG control) speed search starts from the detected frequency (PG).

## Speed Search from Multi-function digital inputs

Set the multi-function digital input to external speed search command 1 or 2 . External speed search command 1 (value $=19$ ) and 2 (value $=34$ ) cannot be set at the same time, otherwise "SE02" (digital input terminal error) warning occurs.

Speed search function must be enabled before applying the run command to ensure proper operation. See relay logic in figure 4.4.65.

Figure 4.4.65 Speed search and operation commands

## Notes: Speed Search Operation

- The speed search cannot be used when the motor rated power is greater than the inverter rated power.
- The speed search cannot be used when the motor rated power is two inverter sizes smaller than the inverter currently used.
- The speed search cannot be used in combination with a high-speed motor.
- If speed search function is used and the control mode is in V/F mode, it is necessary to perform a static auto-tune.
- If speed search function is used and the control mode is in SLV mode, it is necessary to perform a rotational auto-tune. Perform a static auto-tune when using long motor leads.

Speed search uses current detecting. Use parameter 07-24 to select detection direction.

## 07-19: Speed Direction Search Operating Current

- Used in bidirectional speed search only (07-24 = 1) .
- Set bidirectional current level.
- Increase value if speed search is not successful at low speeds (above 5Hz)

Note: If value is too high may cause DC braking effect.

## 07-20: Speed Search Operating Current

- Can be used for bidirectional $(07-24=1)$ or unidirectional $(07-24=0)$ speed search.
- Sets speed search current Level.
- The set value must be lower than the excitation current (02-09) and must equal to the no-load current. If the no-load current is unknown it is recommended to set value at $20 \%$.
- Excessive speed search current will cause inverter output to saturate.
- It is recommended to use speed search in case of a momentary power loss. Increase the minimum base block time (07-18) in case of an over-current condition.

## 07-21: Integral time of speed searching

- Can be used for bidirectional $(07-24=1)$ or unidirectional $(07-24=0)$ speed search.
- Set the integral time during speed search.
- If OV occurs, increase the set value to increase the speed search time. Decrease the value if a quick start is required

07-22: Delay time of speed searching

- Use delay time when using a contactor on the inverter output side.
- The inverter speed search starts after the delay time expires.
- Speed search delay time is disabled when set to $0.0 \mathrm{sec} .(07-22=0.0)$

07-23: Voltage recovery time

- Sets the voltage recovery time.
- Sets the time for the inverter to restore the output voltage from 0 V to the specified $\mathrm{V} / \mathrm{f}$ level after speed search function is completed.

## 07-24: Direction-Detection Speed Search Selection

## 0: Disable Direction-Detection Speed Search

Speed search is executed using speed search operating current defined in parameter 07-20. In case speed search is not successful (e.g. motor speed is too low) a speed search time-out warning is displayed. Set 07-19 to value greater than 0 to enable DC braking at speed search if a time-out occurs frequently.

## 1: Enable Direction-Detection Speed Search

At start the current controller will send a step current to the motor (07-19) to determine the motor direction. Once direction is determined the current controller will perform a speed search using speed search operating current defined in parameter 07-20. Speed search is executed after a momentary power loss (external speed search command 2, 03-00 to 03-07 = 34) or from max. frequency (external speed search command 1, 03-00 to 03-07 = 19). Speed search direction will follow the speed command.

07-26: SLV Speed Search Function

- In SLV mode $(00-00=2)$ set the stop mode to the coast stop $(07-09=1)$ or to the coast to stop with timer $(07-09=3)$. After a stop command is issued (coast to stop or coast to stop with times) the speed search function is automatically activated for the next start.

0: Enable (No mechanical brake is installed)

1: Disable (Mechanical brake is installed)

## 07-27: Start Selection after fault during SLV mode

0: Speed search start: Speed search is executed after a fault in SLV mode.

1: Normal start: Speed search is not enabled.
Note: Set the parameter to 1 (normal start) after a fault has occurred and a mechanical brake is used to stop the motor.

07-28: Start after external Baseblock
0: Speed search start: Speed search is executed after base block is removed.
1: Normal start: Speed search is not enabled.

Note: Set parameter to 1 for control mode is V/F $(00-00=0)$ or SLV mode $(00-00=2)$ when the external base block active time is longer than the time the motor needs to come to a complete stop. After the external base block command is removed the inverter will accelerate from min. frequency.

## 07-32: Speed Search Mode Selection

0: Disable: The inverter start to run from the lowest output frequency but it won't limit the other functions of trigger speed search.

1: Mode1: Execute a Speed Search at Power On: The inverter executes a speed search at power on when entering first run command. It start the motor from found frequency.
2: Execute a Speed Search each time: When PM motor performs speed search, it is recommended to reduce the set value of 20-00 and 20-02 at motor jittering.

## 07-33: Start Frequency of Speed Search Selection

0: Maximum Output Frequency of Motor: The inverter start speed search from the maximum output frequency of motor.
1: Frequency Command: The inverter start speed search from setting frequency command.

## - Speed search based on current detection

(a) Speed search at starting

Figure 4.4.66 Speed search at starting
(b) Speed search in recovery period of momentary power failure

Figure 4．4．67 Speed search in recovery period of momentary power failure

## Notes：

If the minimum base block time（07－18）is longer than the momentary power failure time，the speed search starts operation after the minimum base block time（07－18）．

If the minimum base block time（07－18）is too short，the speed search operation begins immediately after power has been restored．

| $07-29$ | Run Command Selection at the Action of DC Braking |
| :---: | :--- |
| Range | 【0】 ：Not Allowable to Run <br> 【1】：Allowable to Run |

When DC braking is active，then：

## 07－29＝0：

Inverter does not run again until DC braking stops．

## 07－29＝1：

Inverter can run again even if DC braking is in action．

| $07-42$ | Voltage Limit Gain |
| :--- | :--- |
| Range | $【 0.0 \sim 50.0 】 \%$ |

When the output voltage saturation causes the abnormal motor running and then jittering，user can increase the set value of 07－42 to limit the output voltage．

When the value of 07－42 is set too large，insufficient torque may occur．User can decrease the set value to improve this situation．

| $07-43$ | Short－circuit Braking Time of PM Speed Search |
| :---: | :--- |
| Range | $【 0.00 \sim 100.00 】$ Sec |
| $07-44$ | DC Braking Time of PM Speed Search |
| Range | $\lfloor 0.00 \sim 100.00 】$ Sec |

If the motor is in a rotating state due to inertia or the like and the rotation speed is far below the minimum speed control range，parameter 07－43 and 07－44 is set to perform the braking to stop motor and then restart．

If the motor is in a rotating state due to inertia or the like and the rotation speed is higher than the minimum speed control range，the inverter directly finds the frequency to start regardless of the set value of 07－43 or 07－44．

If parameters 07－43 and 07－44 are set to 0 ，the inverter finds the frequency to start after the speed search regardless of the motor＇s rotation speed．

| $07-45$ | STP2 function selection |
| :---: | :--- |
| Range | $【 0 】:$ STP2 is enabled |
|  | $【 1 】:$ STP2 is disabled |

＞If STP2 is enabled，when $00-02=1$ and external operation signal is tripped，keypad will display＂Terminal STOP＂error when stop command comes from keypad．
＞If STP2 is disabled，when 00－02＝1 and external operation signal is tripped，keypad will not display＂Terminal STOP＂error when stop command comes from keypad．

| $07-46$ | DC injection current limit |
| :--- | :--- |
| Range | $0 \sim 150 \%$ |

In manual pulse generator mode，when the output frequency is lower than the minimum output frequency（01－08） of motor 1，the DC current will be injected to brake，the unit of this parameter is the percentage of the motor 1 rated current（02－01）．

| $\mathbf{0 8 - 4 1}$ | Motor2 acceleration stall prevention limit |
| :--- | :--- |
| Range | $1 \sim 100 \%$ |

Note: Stall prevention function only can be set in V/F control mode.

## Stall prevention during acceleration (08-00=xxx0b)

(1) Prevents the inverter from faulting (Overcurrent, Motor overload, Inverter overload) when accelerating with heavy loads.
(2) When the inverter output current reaches the level set in parameter 08-01 minus $15 \%$ the acceleration rate starts to decrease. When the inverter output current reaches the level set in parameter 08-01 the motor stops accelerating.
(3) Reduce stall prevention level during acceleration (08-01) in case the motor stalls (when the motor power is smaller than the inverter rating.

Figure 4.4.68 Stall prevention during acceleration
If the motor is used in the constant power $(\mathrm{CH})$ region, the stall prevention level ( $08-01$ ) is automatically reduced to prevent the stall.

Stall prevention level during acceleration (Constant horsepower)
Stall Prev. Lev. Acceleration $(\mathrm{CH})=$ Stall prevention level in acceleration (08-01) x Fbase (01-12)
Output frequency
Parameter 08-21 is the stall prevention limit value in Constant Horsepower region. Refer to figure 4.4.69.

Figure 4.4.69 Stall prevention level and limit in acceleration
Motor2 Acceleration Stall Prevention Level (08-40) and Motor2 Acceleration Stall Prevention Limit (08-41) are Used when 03-00~03-07=40 (Switching between Motor 1/Motor 2)

## Stall prevention selection during deceleration (08-00=xx0xb)

Stall prevention during deceleration automatically increases the deceleration time according based on the DC-bus voltage to prevent over-voltage during deceleration. Refer to Figure 4.4.69 for stall prevention during deceleration

When the DC-bus voltage exceeds the stall prevention level deceleration will stop and the inverter will wait for the DC-bus voltage to fall below the stall prevention level before continuing deceleration. Stall prevention level can be set by $08-02$, see Table 4.4.34.

Table 4.4.34 Stall prevention level

| Inverter model | 08-02 default value |
| :---: | :---: |
| 200 V class | 385 VDC |
| 400 V class | 770 VDC |
| 575 V class | 950 VDC |
| 690 V class | 1140 VDC |

Note: When using external braking (braking resistor or braking module) disable stall prevention during deceleration (08-00 to $x x 1 x b$ ).

Figure 4.4.70 Stall prevention selection in deceleration

## Stall prevention selection during run (08-00=x0xxb)

Stall prevention during run can only be used in V/F or V/F + PG and SLV2control mode.

This function prevents the motor from stalling by automatically reducing the output frequency during run.

If the inverter output current rises above the level set in parameter 08-03 for the time specified in parameter $08-22$, the inverter output frequency is automatically decreased following deceleration time $1(00-15)$ or deceleration time 2 (00-17).

When the inverter output current falls below the level set in parameter (08-03) minus $2 \%$, normal operation continues and the output frequency increases to the frequency reference using the acceleration time 1 or acceleration time 2. Refer to the following figure 4.4.71.

Note: The stall prevention level during run can be set by using multi-function analog input Al2 (04-05=7).

Figure 4．4．71 Stall prevention selection in operation

Note：
Stall prevention level in operation is set by multi－function analog input Al2（04－05＝7）．

| 08－05 | Selection for motor overload protection（OL1） |
| :---: | :---: |
| Range | xxx0b：Motor overload is disabled <br> xxx1b：Motor overload is enabled <br> xx0xb：Cold start of motor overload <br> xx1xb：Hot start of motor overload <br> x0xxb：Standard motor <br> x1xxb：Special motor <br> 0xxxb：Reserved <br> 1xxxb：Reserved |
| 08－07 | Motor Overload（OL1）Protection Level |
| Range | 【0】 ：Motor Overload（OL1）Protection 0 <br> 【1】 ：Motor Overload（OL1）Protection 1 <br> 【2】 ：Motor Overload（OL1）Protection 2 |

The motor overload protection function estimates the motor overload level based on the output current，output frequency，motor characteristics and time．The motor overload trip time depends on the motor rated current when the output frequency is greater than 60 Hz ．

On inverter power－up the motor overload protection internal thermal accumulation register is automatically reset．

To use the built－in motor overload protection function parameter 02－01（motor rated current）has to match the motor rated current on the motor nameplate．

Turn off the motor overload protection when using two or more motors connected to the inverter（set 08－05＝ xxx0b），and provide external overload protection for each motor（e．g．thermal overload switch）．

With cold start enabled ( $08-05=\mathrm{xx} 0 \mathrm{xb}$ ), motor overload protection occurs in 5 and a half minutes when operating the motor at $150 \%$ of the motor rated current at an output frequency greater than 60 Hz .

With hot start enabled ( $08-05=x \times 1 \mathrm{xb}$ ), motor overload protection occurs in 3 and a half minutes when operating the motor at $150 \%$ of the motor rated current at an output frequency greater than 60 Hz .

Refer to the following figure 4.4.72 for an example of motor overload protection standard curve. And refer to the setting of 08-07 (Motor overload (OL1) protection level), the overload curve will be different.

08-07=0:

08-07=1:

Figure 4.4.72 Motor overload protection curve (example: standard motor)
When using force cooled motors (Special inverter motor), thermal characteristics are independent of the motor speed, set 08-05 = x1xxb.

When $08-05=x 1 x x b$, overload protection function is based on motor rated current for output frequencies between 6 and 60 Hz . If the output frequency is lower than 1 Hz , the overload protection function uses $83 \%$ of the motor rated current to determine an overload condition.

When $08-05=x 0 x x b$, overload protection function is based on $70 \%$ of the motor rated current for an output frequency of 20 Hz . If the output frequency is lower than 1 Hz , the overload protection function uses $40 \%$ of the motor rated current to determine an overload condition.

Motor overload rating at different output frequencies is shown at Figure 4.4.73.

Figure 4.4.73 Motor overload rating at different output frequencies

| $\mathbf{0 8 - 0 6}$ | Start-up mode of overload protection operation (OL1) |
| :---: | :--- |
| Range | 0: Stop output after overload protection <br> 1: Continuous operation after overload protection. |

08-06=0: When the inverter detects a motor overload the inverter output is turned off and the OL1 fault message will display on the keypad. Press RESET button on the keypad or activate the reset function through the multi-function inputs to reset the OL1 fault.

08-06=1: When the inverter detects a motor overload the inverter will continue running and the OL1 alarm message will flash on the keypad until the motor current falls within the normal operating range.

| $\mathbf{0 8 - 0 8}$ | Automatic voltage regulation (AVR) |
| :---: | :--- |
| Range | $0:$ AVR is enabled <br> $1:$ AVR is disabled |

Automatic voltage regulation stabilizes the motor voltage independent of fluctuation to the input voltage.
$08-08=0$ : Automatic voltage regulation is active. It will limit the maximum output voltage. When input three-phase voltage fluctuates and the voltage is smaller than the value of $01-14$, the output voltage will fluctuate with the fluctuation of input voltage.
08-08=1: Automatic voltage regulation is not active, motor voltage follows the input voltage fluctuation. When input three-phase voltage fluctuates, the output voltage won't fluctuate with the fluctuation of input voltage.

| $08-09$ | Selection of input phase loss protection |
| :---: | :--- |
| Range | $0:$ Disable <br> $1:$ Enable |

$08-09=0$ : Input phase loss detection is disabled.
08-09=1: Input phase loss detection is enabled. Keypad shows "IPL input Phase Loss" (IPL), when an input phase loss is detected the inverter output is turned off and the fault contact is activated.

Note: The input phase loss detection is disabled when the output current is less than $30 \%$ of the inverter rated current.

| $\mathbf{0 8 - 1 0}$ | Selection of output phase loss protection |
| :---: | :--- |
| Range | 0: Disable <br> $1:$ Enable |

$08-10=0$ : Output phase loss detection is disabled.
$08-10=1$ : Output phase loss detection is enabled. Keypad shows "OPL Output Phase Loss" (OPL), when an output phase loss is detected and the inverter output is turned off and the fault contact is activated.

Note: The output phase loss detection is disabled when the output current is less than $10 \%$ of the inverter rated current.

| $\mathbf{0 8 - 1 3}$ | Selection of over-torque detection |
| :---: | :--- |
| Range | 0: Over-torque detection is disabled <br>  |
|  |  |
|  |  |

| $\mathbf{0 8 - 1 4}$ | Selection of over-torque action |
| :---: | :--- |
| Range | 0: Deceleration to stop when over-torque is detected. <br> 1: Displays warning when over-torque is detected. Continue operation. <br> 2: Coast to stop when over-torque is detected |

| $\mathbf{0 8 - 1 5}$ | Level of over-torque detection |
| :--- | :--- |
| Range | $0 \sim 300 \%$ |

| $\mathbf{0 8 - 1 6}$ | Time of over-torque detection |
| :--- | :--- |
| Range | $0.0 \sim 10.0 \mathrm{Sec}$ |

| $\mathbf{0 8 - 1 7}$ | Selection of low-torque detection |
| :---: | :--- |
| Range | 0: Low-torque detection is disabled <br> 1: Start to detect when reaching the set frequency <br> 2: Start to detect when the operation is begun |

| 08-18 | Selection of low-torque action |
| :---: | :--- |
| Range | 0: Deceleration to stop when low-torque is detected <br>  |
|  | 1: Display warning when low-torque is detected. Go on operation |
|  |  |

| $\mathbf{0 8 - 1 9}$ | Level of low-torque detection |
| :---: | :--- |

| $\mathbf{0 8 - 2 0}$ | Time of low-torque detection |
| :---: | :--- |
| Range | $0.0 \sim 10.0 \mathrm{Sec}$ |

The over torque detection function monitor the inverter output current or motor torque and can be used to detect increase in inverter current or motor torque (e.g. heavy load).

The low torque detection function monitor the inverter output current or motor torque and can be used to detect a decrease in inverter current or motor torque (e.g. belt break).

The torque detection levels (08-15, 08-19) are based on the inverter rated output current ( $100 \%$ = inverter rated output current) when operating the inverter in V/F control or V/F control + PG and motor output torque (100\% = motor rated torque) when operating the inverter in SLV or SV control.

## Over-torque detection

Parameter 08-13 selects over-torque detection function. An over-torque condition is detected when the output current / torque rises above the level set in parameter 08-15 (Over-torque detection level) for the time specified in parameter 08-06 (Over-torque detection time).
$08-13=0$ : Over-torque detection is disabled.
08-13=1: Over-torque detection is enabled when the output frequency reaches the set frequency.
$\mathbf{0 8}-13=\mathbf{2}$ : Over-torque detection is enabled during running.
Parameter 08-14 selects the way the inverter acts when an over-torque condition is detected.

08-14=0: When an over-torque condition is detected the inverter displays and over-torque detection fault and the motor decelerates to a stop.

08-14=1: When an over-torque condition is detected the inverter displays an over-torque detection alarm and continues to run.

08-14=2: When an over-torque condition is detected the inverter displays and over-torque detection fault and the motor coasts to a stop

Figure 4.4.74 Over-torque detection operation

## Low-torque detection

Parameter 08-18 selects low-torque detection function. An low-torque condition is detected when the output current / torque falls below the level set in parameter 08-19 (low-torque detection level) for the time specified in parameter 08-20 (Low-torque detection time).

08-17=0: Low-torque detection is disabled.
$08-17=1$ : Low-torque detection is enabled when the output frequency reaches the set frequency.
$08-17=2$ : Low-torque detection is enabled during running.
Parameter 08-18 selects the way the inverter acts when an over-torque condition is detected.
08-18=0: When a low-torque condition is detected the inverter displays and low-torque detection fault and the motor decelerates to a stop.

08-18=1: When a low-torque condition is detected the inverter displays a low-torque detection alarm and continues to run.

08-18=2: When a low-torque condition is detected the inverter displays and low-torque detection fault and the motor coasts to a stop
. Setting Example of less torque detection:

Figure 4.4.75 Low torque detection operation

Over and low torque detection condition can be output to the multi-function digital outputs (R1A-R1C, R2A-R2C) by setting parameters $03-11$ to $03-12$ to 12 or 25 . Refer to figure 4.4.76 for more information.

Figure 4.4.76 Over-torque / low torque detection multi-function digital output terminal

| $08-23$ | Ground Fault (GF) selection |
| :---: | :--- |
| Range | 0: Disable <br> $1:$ Enable |

## 08-23=1:

If the inverter leakage current is greater than $50 \%$ of inverter rated current and the ground fault function is enabled (08-23), the keypad will display a "GF Ground Fault" (GF), motor will coast to a stop and fault contact is activated.

| $08-24$ | External fault operation selection |
| :--- | :--- |
| Range | 0: Deceleration to stop |
|  | 1: Coast to stop |
|  | 2: Continue operation |

Select operation selection when an external fault occurs. Refer to the multi-function inputs on how to set up the inverter for an external fault input.

| $08-25$ | Detection selection of external fault |
| :---: | :--- |
| Range | 0: Immediately detect when the power is supplied <br> $1:$ Start to detect during operation |

08-25=0: When the inverter is supplied by power, detection external fault function will execute.

08-25=1: When the inverter is start to run, detection external fault function will execute.

| $08-30$ | Run permissive function selection |
| :---: | :--- |
| Range | 0: Deceleration to stop <br> $1:$ Coast to stop |

When 03-00~03-07=58, the inverter will stop by the set of 08-30

| $08-37$ | Fan control function |
| :---: | :--- |
| Range | 0: Start in operation <br> 1: Permanent start <br> 2: Start in high temperature (except of the models of 2050, 4100 or the above) |
|  | Delay time of fan off |
|  | $0 \sim 600$ sec |

$\mathbf{0 8 - 3 7}=0$ : The inverter start to run and the fan will follow to run. If the inverter stop and the time is longer than the value of 08-38, the fan stop. If the temperature for heat sink is higher than the temperature of inside-detection and the inverter doesn't run, the fan will start run automatically.
$08-37=1$ : The inverter is supplied by power, the fan start to run.

08-37=2: The temperature for heat sink is higher than the temperature of inside-detection, the fan start to run. After the temperature for heat sink is lower than the temperature of inside-detection and the time is over 08-38, the fan stop.
Note: There is no $08-37=2$ for the models of 2050, 4100 or the above.

| $08-35$ | Motor overheat fault selection |

## Motor overheat fault selection

It execute motor overheat protection by the resistor（PTC）that built－in the motor．
the resistor（PTC）is between AI2 and GND and a divided resistor R ，as the pic 4．3．65（b）
$08-35=0$ ：Motor overheats fault function is off．
08－35＝1：When the motor is overheating，it decelerates to stop．
$\mathbf{0 8}-\mathbf{3 5}=\mathbf{2}$ ：When the motor is overheating，it free runs to stop．
$08-35=3$ ：When the motor is overheating，it does not stop running until reach the value of 08－42．
$08-35=1, ~ 2$ ：When the temperature is getting higher for the motor and Al2 voltage level is higher than the value of $08-44$ ，the display will show 『 OH 4 Motor Overheating 』 and the motor will stop by $08-35=1,2$ ．
$08-\mathbf{3 5}=3$ ：When the temperature is getting higher for the motor and AI2 voltage level is higher than the value of $08-44$ ，the display will show 『OH3 Motor Temp Warning』 but the motor continues running．But Al2 voltage level is higher than the value of $08-42$ and the time reach to $08-39$ ，the motor free runs to stop．
$08-35=1, ~ 2, ~ 3$ ：When the motor cools down and Al2 voltage level is lower the value of $08-43, 『 \mathrm{OH} 4$ Motor overheat $』$ will reset．

Note：The resistor（PTC）conform the British Standards Institution：
When Tr is $150^{\circ} \mathrm{Cin}$ Class F and is $180^{\circ} \mathrm{C}$ in Class H 。
$\mathrm{Tr}-5^{\circ} \mathrm{C}: \mathrm{RT} \leqq 550 \Omega$ ，put the value of $R T$ in formula（1），the V value by calculation is the value of 08－43．
$\mathrm{Tr}+5^{\circ} \mathrm{C}: \mathrm{RT} \geqq 1330 \Omega$ ，put the value of RT in formula（1），the V value by calculation is the value of 08－44． It gets reference value by using formula（1）even in the different spec of resistor（PTC）．

$$
V=\frac{1}{2} \times 10 \times \frac{R_{P T C} / / 200}{R+\left(R_{P T C} / / 200\right)} \cdots----- \text { Formula (1) }
$$

## ！Danger ：

Fire mode：
The drive will run at full speed either in forward or reverse direction and ignore all software protections until any one of the hardware protection is triggered or drive is damaged to achieve the requirement of smoke extraction and reduce the hazard to humans．
$>$ Each bit of $08-50$ presents an input：
$08-50=0 \quad 0 \quad 0 \quad 0 \quad 0 \quad$ ：Normal open
s6 1 ：Normal close
Notes：
Please set $08-48=0$（fire mode disabled）before setting normal open or normal close contact．
Failure to comply may cause death or serious injury．
$>$ When $08-51=0$ ，motor speed setting will follow $08-52$ ．If the value of $08-52$ is $100 \%$ ，inverter output frequency will follow the value of 01－02．
$>$ When $08-51=1$ ，motor speed setting will follow PID control；when fire mode is enabled，PID control will base on 10－47／10－48／10－49（please refer the setting value of group 10）
$>$ When $08-51=2$ ，frequency reference will become to $4-20 \mathrm{~mA}$（default setting of 04－00）

## 08－59：Fire Mode Motor Direction

$>$ When fire mode is enabled，motor direction will base on the setting of 08－59．

## 08－60：Fire Mode Password

$>$ When fire mode is enabled，use can set password in parameter 08－60，please refer the process of parameter 13－07．
$>$ In order to prevent the parameters of fire mode being modified，keypad display will just show the related parameters of fire mode when fire mode is enabled．（Parameter 08－48～08－60 will be read only）．
＞Parameter 08－60（password of fire mode）and 13－07（parameter password），only one parameter can be allowed to set at the same time．

| $08-53$ | PID Detection Level of Fire Mode |
| :---: | :--- |
| Range | $【 0 \sim 100 】 \%$ |
| $08-54$ | Delay Time of Fire Mode PID Loss |
| Range | 【0．0～10．0】 Sec |
| $08-55$ | PID Feedback Loss Detection Selection of Fire Mode |
|  | $【 0 】:$ Keep Running |
| Range | $【 1 】:$ Fire Mode Speed（08－52） |
|  | $【 2 】:$ Max．Output Frequency of Motor $1(01-02)$ |

$>$ When $08-51=1$ ，PID feedback loss detection function will be opened automatically．
$>$ When fire mode is enabled，if 08－51＝1 and then PID feedback，inverter will be stopped after the setting value of 08－54．

## 08－55：PID Feedback Loss Detection Selection of Fire Mode

＞When $08-55=0$ ，output frequency will be fixed on current frequency．
＞When $08-55=1$ ，output frequency will be based on the setting value of parameter 08－52．
＞When $08-55=2$ ，output frequency will be based on the setting value of parameter 01－02．

When PID feedback value less than 08－53 and then longer than 08－54，inverter will keep running，but the frequency reference will be switched to $08-55$ ，output frequency will not less than the setting value of $08-52$ ．

PID feedback loss detection
Notes：
If there is no any feedback signal and then feedback loss level also be set to $0 \%$ ，feedback loss detection function will not be triggered．

| $\mathbf{0 8 - 5 6}$ | Detection Level of Fire Mode AI2 Signal |
| :---: | :--- |
| Range | 【0～100】 \％ |
| $08-57$ | Delay Time of Fire Mode Al2 Signal Loss |
| Range | 【0．0～10．0】 Sec |
| $08-58$ | Selection of Fire Mode Al2 Signal Loss |
| Range | 【0】：Keep Running |
|  | 【1】：Fire Mode Speed（08－52） |
|  | 【2】：Max．Output Frequency of Motor 1（01－02） |

When 08－51＝2（Al2），inverter will trigger Al2 feedback loss detection function automatically．
Selection of Fire Mode Al2 Signal Loss（08－58）：
$>$ When 08－58＝0，output frequency will be fixed on current frequency．
（When $08-58=1$ ，output frequency will be based on the setting value of parameter $08-52$ ．
＞When 08－58＝2，output frequency will be based on the setting value of parameter 01－02．

If Al2 signal is less than the setting value of $08-56$ in 360 ms ，and the time longer than setting value of $08-57$ ，the frequency reference will be considered to loss．
Analog signal will compare with the previous value at 360 ms ，if inverter ensure the frequency reference already loss，frequency reference will base on the value of 08－58．

Following is the description of the Frequency Loss Function：
When the inverter is in operation and the selected analog command source Al2 disappears，the command will operate according to the setting ratio of $08-58$ ．

The following figure is the operating diagram of analog frequency instruction Al 2 when the frequency Instruction is lost.

Fig 4.3.76 Al2 frequency reference loss

| 09-09 | Waiting time |
| :---: | :--- |
| Range | $5 \sim 65 \mathrm{msec}$ |

The Modbus communication port RJ45 (S+, S-) can be used to monitor, control, program and trouble-shoot the inverter.

Modbus communication can perform the following operations, independent of the frequency command selection (00-05) setting and Operation command selection (00-02) setting:

- Monitor inverter signals
- Read and write parameters.
- Reset fault
- Control multi-function inputs

## Modbus (RS-485) communication specification:

| Items | Specification |
| :--- | :--- |
| Interface | RS-485 |
| Communication type | Asynchronous (start - stop synchronization) |
| Communication parameters | Baud rate: 1200, 2400, 4800, 9600, 19200 and 38400 bps <br> Data Length: 8 bits (Fixed) <br> Parity: options of none, even and odd bit. <br> For even and odd selection stop bit is fixed at 1 bit. |
| Communication protocol | Modbus RTU / ASCII |
| Number of inverters | Maximum 31 units |

## Communication wiring and setup

(1) Turn off power to the inverter.
(2) Connect communication lines of the controller to the inverter (RJ45).
(3) Turn power on.
(4) Set the required communication parameters (09-00) via the keypad.
(5) Turn off power to the inverter and wait until keypad is completely off.
(6) Turn power on
(7) Start communication between controller and inverter.

## Modbus (485) communication architecture

(1) Modbus communication configuration uses a master controller (PC, PLC), communicating to a maximum of 31 inverters.
(2) The master controller is directly connected to the inverter via the RS-485 interface. If the master controller has a RS-232, a converter must be installed to convert signals to RS-485 to connect the master controller to the inverter.
(3) A maximum 31 inverters can be connected to a network, following the Modbus communication standard.

## Communication Parameters:

09-00: Inverter station addresses: Range 1-31
09-02: RS-485 communication baud rate setting
= 0: 1200 bps (bits / second)
= 1: 2400 bps
= 2: 4800 bps
= 3: 9600 bps
= 4: 19200 bps
$=5: 38400 \mathrm{bps}$
09-03: Stop bit selection
$=0: 1$ stop bit
$=1: 2$ stop bits
09-04: Parity selection of RS-485 communication
= 0: No parity.
= 1: even parity.
= 2: odd parity.

## 09-05: Communication Data Bit Selection

$=0: 8$ bits data
$=1: 7$ bits data

09-06: RS-485 communication error detection time

09-07: Stop selection of RS-485 communication failure
= 1: Deceleration to stop by deceleration time 00-15
= 2: Coast to stop
= 2: Deceleration to stop using the deceleration time of 00-26 (emergency stop time)
$=3$ : Continue to operate (only shows a warning message, press the stop button to stop operation)
09-08: Comm. fault tolerance count
When the number of communication errors exceeds the value set in parameter 09-08 the inverter will display the comm. Fault alarm.

09-09: Wait time of inverter transmission (09-09).
Set the inverter response delay time. This is the time between the controller message and the start of the inverter response message. Refer to figure 4.4.77. Set the controller receive time-out to a greater value than the wait time parameter (09-09).

Figure 4.4.77 Communication Message Timing

| $\mathbf{1 0 - 0 0}$ | PID target value source setting |
| :--- | :--- |
|  | 1: Al1 given |
|  | 2: Al2 given |
| Range | 3: Pulse given |
|  | 4: Use 10-02 setting |
|  | 5: Reserved |
|  | 6: Frequency Command (00-05) |

When $10-00=1$ or 2 ,

Source of signal is proportional to be corresponding to PID target via analog input terminal.
For example:
$0 \sim 10 \mathrm{~V}$ is corresponding to $0 \sim 100 \%$ target value. When being given $2 \mathrm{~V}, 20 \%$ target value is obtained.

## When 10-00=3,

PID target value is pulse input. The proportion of pulse input is set depending on the parameters of 03-30 (pulse input scales) ~ 03-34 (pulse input filter time).

For general purpose of PID setting, set $10-00=4$ to set the PID target value.

## When 10-00=4

10-02(PID target value) is set at percentage and PID setting is at main screen monitor (12-38).

Maximum target value is set by parameter 10-33 (PID feedback maximum value), the decimals is determined by parameter10-34 (PID decimal width), and the unit is set by parameter 10-35 (PID unit).

Ex:
Set 10-33 = 999, $10-34=1,10-35=3$, and set 10-02 to $10 \%$
Then 9.9PSI is displayed at the main screen monitor (12-38) and can be modified at this monitor. Maximum value is 99.9 PSI (limited to the setting value of parameter 10-33).

## When 10-00=6

The current frequency command is proportional to be corresponding to PID target.

| $10-01$ | PID feedback value source setting |
| :--- | :--- |
| Range | 1: Al1 given <br>  <br>  |
|  |  |
|  |  |

Note: Parameter 10-00 and 10-01 cannot be set to the same source. If both parameters are set to the same source the keypad will show a SE05 alarm.

| $10-02$ | PID target value |
| :---: | :--- |
| Range | $0.00 \sim 100.00 \%$ |

| 10-03 | PID control mode |
| :---: | :---: |
| Range | xxx0b: PID disable <br> xxx1b: PID enable <br> xx0xb: PID positive characteristic <br> xx1xb: PID negative characteristic <br> $\mathbf{x 0 x x b}$ : PID error value of $D$ control <br> x1xxb: PID feedback value of $D$ control <br> 0xxxb: PID output <br> 1xxxb: PID output + Frequency Command |

PID target value source setting(10-00) / PID feedback value source setting(10-01)
Please confirm parameter $04-00$ conform the need ( $0 \mathrm{~V} \sim 10 \mathrm{~V}$ or $4 \mathrm{~mA} \sim 20 \mathrm{~mA}$ ) if $\mathrm{Al2}$ as PID target or PID feedback. And switch SW2 (U Type) or SW4 ( UE type) from control board to the input type (V or I), please refer to wiring diagram for more detail.

When $10-03=x x x 1 b$ : PID is enabled, LCD keypad will be switched automatically (16-00) and main screen monitoring displays PID target value (12-38). Sub-screen monitoring 1 (16-01) displays PID feedback value (12-39) and sub-screen monitoring 2 (16-02) displays frequency output (12-17). If PID is disabled, the keypad will switch automatically to frequency command setting as the main page.

When $\mathbf{1 0 - 0 3 =} \mathbf{x x 1 x b}$ : PID output is reverse. PID output is chosen to reverse, and if PID input is negative, the output frequency of PID will gain. On the contrary, PID output is chosen to forward, and if PID input is minus, the output frequency of PID will decrease.
Refer to Fig. 4.4.78 \& 4.4.79 when 10-03= x1xxb: feedback value differential of PID control and 10-03= x0xxb: basic PID control

When 10-03= 0xxxb: PID output, it corresponds $100 \%$ to the frequency of $01-02$. When $\mathbf{1 0 - 0 3}=1 \mathbf{1 x x x b}$ : PID output + frequency command, it will cumulate the output percentage of frequency command, (corresponding to 01-02 main frequency command set by parameter 00-05/ 00-06) at the beginning of running and then start PID control.

## PID Adjustments

Gain control: The error signal (deviation) between the input command (set value) and the actual control value (feedback). This error signal or deviation is amplified by the proportional gain $(\mathrm{P}$ ) to control the offset between the set value and the feedback value.

Integral control: The output of this control is the integral of the error signal (difference between set value and feedback value) and is used to minimize the offset signal that is left over from the gain control. When the integral time (I) is increased, the system response becomes slower.

Differential control: This control is the inverse from integral control and tries to guess the behavior of the error signal by multiplying the error with the differential time. The result is added to the PID input. Differential control slows down the PID controller response and may reduce system oscillation.
Note: Most applications that PID control (fan and pump) do not require differential control. Refer to Figure 4.4.78 for PID control operation

Figure 4.4.78 PID Control

## PID Control Type

The inverter offers two types of PID control:
(a) PID control with differential feedback: $(10-03=\mathrm{x} 1 \mathrm{xxb})$

Make sure to adjust the PID parameters without causing system instability. Refer to Figure 4.4.79 for PID control for feedback value differential.

Figure 4.4.79 PID control for feedback differential value
(b) Basic PID control: (10-03 $=x 0 x x b)$

This is the basic type of PID control. Refer to the figure 4.4.80.

Figure 4.4.80 Basic PID control

## PID Setup

Enable PID control by setting parameter 10-03, PID target value (10-00) and PID feedback value (10-01).
(1) Select PID target value (10-00):

10-00: PID target value
=1: analog Al1 given (default)
=2: analog AI2 given
=3: Pulse given
=4:10-02
$=6$ frequency command (00-05)
(2) Select PID feedback value (10-01):

## 10-01: PID feedback value

= 1: Analog Al1 given
= 2: Analog Al2 given
$=3$ : Pulse given

Figure 4.4.81 PID input selection

## PID Control Setting

PID control block diagram.

The following figure shows the PID control block diagram.

Figure 4.4.82 PID control block diagram

## PID Tuning

Use the following procedures to start PID control,
(1) Enable PID control (set 10-03 to a value greater than "xxx0b").
(2) Increase the proportional gain (10-05) to the highest value possible without causing the system to become unstable.
(3) Decrease the integral time (10-06) to the lowest value possible without causing the system to become unstable.
(4) Increase the differential time (10-07) to the highest value possible without causing the system to become unstable.

The PID control serves to maintain a given process within certain limits whether it is pressure, flow etc. To do this the feedback signal is compared to the set value and the difference becomes the error signal for the PID control.

The PID control then responds by trying to minimize this error. The error is multiplied times the value of the Proportional gain set by parameter 10-05. An increased gain value results in a larger error. However, in any system as the gain is increased there is a point that the system will become unstable (oscillate).

To correct this instability, the response time of the system may be slowed down by increasing the Integral time set by parameter $\mathbf{1 0 - 0 6}$. However slowing the system down too much may be unsatisfactory for the process.

The end result is that these two parameters in conjunction with the acceleration time (01-14) and deceleration (01-15) times require to be adjusted to achieve optimum performance for a particular application.

PID output polarity can be selected with parameter 10-03 (setting $=x x 0 x b$ : PID output forward, setting $=x x 1 \times b$ : PID output reversal). When PID output is chosen to reverse, and if PID input is negative, the output frequency of PID will gain. On the contrary, PID output is chosen to forward, and if PID input is minus, the output frequency of PID will decrease.

PID feedback value can be adjusted using parameter 10-04 (PID feedback gain) as well as with the analog input gain and bias for terminal AI1 or AI2.

10-14: PID integral limit: Used to limit the integral output to prevent motor stall or damage to the system in case of a rapid change in the feedback signal. Reduce the value of 10-14 to increase the inverter response.

10-23: PID limit: Used to limit the output of the PID control. Maximum output frequency is $100 \%$.

10-10: Primary delay time: Low pass filter situated after the PID limit block that can be used to prevent PID output resonance. Increase the time constant to a value greater than the resonance frequency cycle and reduce time constant to increase the inverter response.

10-09: PID bias: Used to adjust the offset of the PID control. The offset value is added to the frequency reference as compensation. Use parameter 10-24 (PID output gain) to control the amount of compensation.

In case the PID control output value goes negative, parameter 10-25 (PID reversal output selection) can be used to reverse the motor direction.

Note: The PID output remains at zero when reverse operation is disabled.

10-26: PID target SFS: Sets the PID target value acceleration and deceleration ramp time. The PID target SFS can be disabled by setting the multi-function digital inputs 03-00 ~ 03-07 to 36 (PID target SFS is off). Reduce the acceleration / deceleration time in case load resonance or system instability is encountered.

## PID Fine Tuning

All PID control parameters are related to each other and require to be adjusted to the appropriate values. Therefore, the procedure achieving the minimum steady-state is shown as following:
(1) Increase or decrease the proportion (P) gain until the system is stable using the smallest possible control change.
(2) The integral (I) reduces the system stability which is similar to increasing the gain. Adjust the integral time so that the highest possible proportional gain value can be used without affecting the system stability. An increase in the integral time reduces system response.
(3) Adjust the differential time if necessary to reduce overshoot on startup. The acceleration / deceleration time can also be used for the same purpose.

Fine-tuning PID control parameters:
(1) Reduce overshoot

In case overshoot occurs, reduce the derivative time (D) and increase the integral time (I).
(2) Stabilize PID control

(3) Reduce long-period oscillation

(4) Reduce short-period oscillation

To quickly stabilize the PID control, reduce the integral time (I) and increase the differential time (D) in case overshoot occurs.

Adjust the integral time (I) in case of long-periodical system oscillation.

Adjusting the differential time (D) and proportional (P) gain when experiencing short-periodical oscillation.

| 10-11 | PID feedback loss detection selection |
| :--- | :--- |
| Range | 0: Disable |
|  | 1: Warning |
|  | 2: Fault |

| $10-12$ | PID feedback loss detection level |
| :---: | :--- |
| Range | $0 \sim 100 \%$ |

| $10-13$ | PID feedback loss detection time |
| :---: | :--- |
| Range | $0.0 \sim 10.0 \mathrm{Sec}$ |

The PID control function provides closed-loop system control. In case PID feedback is lost, the inverter output frequency may be increase to the maximum output frequency.

It is recommended to enable to the PID feedback loss when the PID function is used.

## PID feedback loss detection

10-11=0: Disable
10-11=1: Warning
A feedback loss condition is detected when the PID feedback value falls below the value set in parameter 10-12 (PID feedback loss detection level) for the time set in parameter 10-13 (PID feedback loss detection time). PID feedback loss warning message " Pb " will be displayed on the keypad and the inverter will continue to operate.

10-11=2: Fault
A feedback loss condition is detected when the PID feedback value falls below the value set in parameter 10-12 (PID feedback loss detection level) for the time set in parameter 10-13 (PID feedback loss detection time). PID feedback loss fault message "Pb" will be displayed on the keypad, the inverter stops and the fault contact is activated.

Figure 4.4.83 PID feedback loss detection

| 10-17 | Start frequency of PID sleep |
| :---: | :--- |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |

| $\mathbf{1 0 - 1 8}$ | Delay time of PID sleep |
| :---: | :--- |
| Range | $0.0 \sim 255.5 \mathrm{Sec}$ |

| $\mathbf{1 0 - 1 9}$ | Frequency of PID wakeup |
| :---: | :--- |
| Range | $0.00 \sim 599.00 \mathrm{~Hz}$ |

| $\mathbf{1 0 - 2 0}$ | Delay time of PID wakeup |
| :--- | :--- |
| Range | $0.0 \sim 255.5 \mathrm{Sec}$ |

| $10-29$ | PID sleep selection |
| :---: | :--- |
| Range | 0: Disable <br> 1: Enable <br> 2: Set by DI |

| $10-40$ | Selection of PID Sleep Compensation Frequency |
| :---: | :--- |
| Range | 0: Disable <br> 1: Enable |

The PID Sleep function is used to stop the inverter when the PID output falls below the PID sleep level (10-17) for the time specified in the PID sleep delay time parameter (10-18).

The inverter wakes up from a sleep condition when the PID output (Reference frequency) rises above the PID wake-up frequency (10-19) for the time specified in the PID wake-up delay time (10-20).

Use parameter 10-29 to enable / disable PID sleep function.
10-29 =0: PID Sleep function is disabled.
10-29 =1: PID sleep operation is based on parameters of 10-17 and 10-18.
$\mathbf{1 0 - 2 9}=\mathbf{2}$ : PID sleep mode is enabled by multi-function digital input

Refer to figure 4.4.84 (a) and (b) for PID sleep / wakeup operation.

Figure 4.4.84: (a) PID control bock diagram

Figure 4.4.84: (b) Timing diagram PID sleep / wakeup

Figure 4.4.84: (c) Timing diagram of PID sleep compensation frequency/ wakeup

## Notes:

$10-40=0$, refer to Figure 4.4 .84 (b)
The PID sleep timer is enabled when the output frequency (Fout) falls below the PID sleep frequency (10-17). When the sleep timer reaches the set PID sleep delay time (10-18) the inverter will decelerate to a stop and enter the sleep mode.

## 10-40=1, refer to Figure 4.4 .84 (c)

When output frequency (Fout) is lower than PID sleep frequency set by 10-17, Timer of PID sleep mode will run and the output frequency changes with the reference frequency (Fref) until it reaches the minimum output frequency (Fmin) set by 01-08. When the PID sleep delay time (10-18) is completed, the motor will run gradually to the PID sleep frequency set by 10-17.

Note: It should be used in the situation of being required the constant frequency.
While sleep mode is active and the motor has stopped, the internal PID control is still in operating. When the reference frequency increases and exceeds the wakeup frequency parameter 10-19 for the time specified in the wakeup delay time parameter 10-20, the inverter will restart and the output frequency will ramp up to the reference frequency.

## Example:

-- When wakeup frequency< sleep frequency, inverter starts by the sleep frequency and sleeps depending on wakeup frequency.
-- When wakeup frequency> sleep frequency, inverter starts by the wakeup frequency and sleeps depending on sleep frequency.

Example: Sleep mode only have positive direction, if set 10-25 = 1 (Allow the reversal output), the sleep mode must be closed.
-- 10-00 and 10-01 can't set to the same source, if set the same values, the keypad will display "SE05 " PID selection error message.
-- When PID sleep selection is enabled or set by DI (10-29 = 1 or 2 ), and PID reversal output selection $10-25=1$ (Allow the reversal output), the keypad will display "SE05" PID selection error message.
-- When PID sleep selection is enabled or set by $\mathrm{DI}(10-29=1$ or 2 ), and PID control mode $10-03=1 \mathrm{xxxb}$ (PID output + Frequency Command, the keypad will display " SE05" PID selection error message.
-- Use parameter 10-29 to enable or disable PID sleep function.
10-29 = 0: PID disable
= 1: PID enable, operate by parameter 10-17 and 10-18.
$=2$ : PID set by DI.

| 10-27 | PID Feedback Display Bias |
| :--- | :--- |
| Range | $0 \sim 9999$ |

## PID Feedback Display Scaling

The PID feedback signal can be scaled to represent actual engineering units. Use parameter 10-33 to set the maximum value of PID feedback and parameter 10-27 to the feedback signal minimum.

## Example:

Feedback signal is a pressure transducer ( $0-10 \mathrm{~V}$ or $4-20 \mathrm{~mA}$ ) with a range of $1.0-20.0 \mathrm{PSI}$ $4 \mathrm{~mA}(0 \mathrm{~V})=1.0 \mathrm{PSI}, 20 \mathrm{~mA}(10 \mathrm{~V})=20.0 \mathrm{PSI}$.

Set parameter 10-27 to 10 minimum of transducer range (0\%).
Set parameter 10-33 to 200 maximum of transducer range (100\%).
Refer to the figure 4.4.85 for displaying the unit conversion.

Figure 4.4.85 Feedback signal scaling

| 10－30 | Upper Limit of PID Target |
| :---: | :--- |
| Range | $0 \sim 100 \%$ |

| 10－31 | Lower Limit of PID Target |
| :---: | :--- |
| Range | $0 \sim 100 \%$ |

Target value of PID will be limited to the range of upper \＆lower limit of PID target．

| $10-33$ | Maximum Value of PID Feedback |
| :---: | :--- |
| Range | $1 \sim 10000$ |

When the maximum value of PID feedback is active，it will become $100 \%$ the corresponding value of 10－02．

| 10－34 | PID Decimal Width |
| :---: | :--- |
| Range | $0 \sim 4$ |

PID decimal width is used for rounding up setting．For example：set $10-34=1$ ，it displays $\mathrm{XXX} . \mathrm{X}$ ；set $10-34=2$ ，it displays XX．XX．

| 10－35 | PID Unit |
| :---: | :--- |
| Range | $0 \sim 24$ |

PID unit is selected depending on user＇s needs．
Note：When user switches PID in LED keypad，10－33 is required to be lower than 1000 and $10-34=1$ ，or the keypad will show a SE05 alarm（PID setting error）．

| 10－39 | Output Frequency Setting of PID Disconnection |
| :---: | :--- |
| Range | $00.00 \sim 599.00 \mathrm{~Hz}$ |

When PID feedback disconnection is in alarm，frequency command output depends on the setting value of 10－39． If the warning is lifted，PID control is restored．
＊When the motor＇s maximum output frequency is over than 300 Hz ，the frequency resolution is 0.1 Hz ．

| $10-08$ | Al1 Frequency Limit |
| :--- | :--- |
| Range | $00.00 \sim 599.00 \mathrm{~Hz}$ |
| $10-15$ | PID Trim Mode |
| Range | $0 \sim 2$ |
| $10-16$ | PID Trim Scale |
| Range | $0 \sim 100$ |

| $\mathbf{1 0 - 4 1}$ | PID Mode Switch |
| :---: | :--- |
| Range | 【0】：General PID |
|  | $【 1$ ：D Type PID |

## Signal Given and Process：

When $10-41=1$（ $D$ type PID），A510s can process the ratio conversion for external signal，and then the signal given value can correspond to the speed command．

The Signal given corresponds to the speed command mode：

－Use the follow steps to start D type PID control：
（1）10－03（PID control mode）set to 1001b．
（2）10－00（PID target value source）set to 4 （10－02 given）．
（3）10－01（PID feedback value source）set to 2 （Al2 given）．
（4）00－05（Main frequency command source selection）set to 1 （External terminal：Analog 1）．
（5）10－29 PID sleep selection set to 0 （Disable）．
－The maximum frequency limit is set by 10－08．
－10－25 PID reversal output selection decide the output can or cannot reversal run．
－The first bit of 10－03 PID control mode decide to plus the frequency command．
－The response of PID control can be adjust 10－36（Proportional gain 2），10－37（Integral Time 2）and 10－38 （Differential Time 2）
－10－15（PID trim mode）set to 1 （Proportional），use the multiple of 01－02（Maximum output frequency of motor）and 01－12（Base frequency of motor），then multiply the frequency of 00－05（Main frequency command source selection），then multiply 10－16（PID trim scale），the value can be used to modify the PID multiple．
－10－15（PID trim mode）set to 0 （Not select），use 01－02（Maximum output frequency of motor）multiply 10－16 （PID trim scale），the value can be used to modify the PID multiple．

| $10-47$ | Proportioanl Gain（P）of Fire Mode |
| :--- | :--- |
| Range | $【 0.00 \sim 10.00 】$ |
| $10-48$ | Integral Time（I）of Fire Mode |
| Range | $【 0.0 \sim 100.0 】$ Sec |
| $10-49$ | Differential Time（D）of Fire Mode |
| Range | $【 0.00 \sim 10.00 】$ Sec |

PID functions of fire mode，please refer to parameter group 08.

| $11-00$ | Direction Lock Selection |
| :--- | :--- |
| Range | 0：Allow forward and reverse rotation |
|  | 1：Only allow forward rotation |
|  | 2：Only allow reverse rotation |

If motor operation direction is set to 1 or 2 ，the motor can only operate in that specific direction．Run commands in the opposite direction are not accepted．

Forward or reverse commands can be issued via the control terminals or keypad．

Note：The Direction Lock Selection can be used in fan and pump application where reverse rotation is prohibited．

| $11-01$ | Carrier frequency |
| :---: | :--- |
| Range | 【0】：Carrier Output Frequency Tuning |
|  | 【1～16】：1～16KHz |

## Notes：

（1）Value 1 to 16 represents KHz ．
（2）When 11－01＝0，variable carrier frequency is used see parameter 11－30～11－32．
（3）For SLV and SV mode，the minimum value of $11-01$ is 2 kHz ，due to the sample rate，suggest to use 4 KHz ， and the motor cable used within 100 m ．
（4）Setting range is determined by the inverter rating（13－00）and HD／ND mode（00－27）．
（5）Refer to section 3 inverter derating based on carrier frequency．
（6）A low carrier frequency increases motor noise but reduces motor losses and temperature．
（7）A low carrier frequency decreases RFI，EMI interference and motor leakage current．
Refer to the carrier frequency Table 4．4．35．
Table 4．4．35 Carrier frequency settings

If cable length between the inverter and the motor is too long，the high－frequency leakage current will cause an increase in inverter output current，which might affect peripheral devices．Adjust the carrier frequency to avoid this as shown in table 4．4．36．

Table 4．4．36 Cable length and carrier frequency

| Wire length | ＜ $\mathbf{3 0}$ Meter（98ft） | up to 50 Meter <br> $(164 \mathrm{ft})$ | up to $\mathbf{1 0 0}$ Meter <br> $(\mathbf{3 2 8 f t})$ | $>\mathbf{1 0 0}$ Meter＊ <br> $>\mathbf{3 2 8 f t}$ |
| :---: | :---: | :---: | :---: | :---: |
| Carrier frequency <br> $(11-01$ value $)$ | Max．value 16 KHz <br> $(11-01=16 \mathrm{KHz})$ | Max．value 10 KHz <br> $(11-01=10 \mathrm{KHz})$ | Maxi．value 5 KHz <br> $(11-01=5 \mathrm{KHz})$ | Max．value 2 KHz <br> $(11-01=2 \mathrm{KHz})$ |

## ＊．If Cable is longer than 200m，the output dv／dt filter or output reactor is required．

## Notes：

（1）Reduce the carrier frequency if the torque does not match the speed．
（2）In V／F and V／F＋PG control modes，set 11－01 to 0 ，the carrier frequency is determined by parameters 11－30 （Carrier frequency max．limit），11－31（Carrier frequency lower limit）and 11－32（Carrier frequency
proportional gain）．

| $\mathbf{1 1 - 0 2}$ | Soft PWM Function Selection |
| :---: | :--- |
| Range | 【0】：Disable |
|  | 【1】：Soft PWM 1 enables |
|  | 【2】：Soft PWM 2 enables |

11－02＝0：Soft PWM control disables．
11－02＝1：Soft PWM 1 control enables．Soft PWM control can improve the＇metal＇noise produced by the motor， more comfortable for the human ear．At the same time，Soft PWM also limits RFI noise to a minimum level．The default setting of Soft PWM control is disabled．Soft PWM 1 cannot be set if carrier frequency set in 11－01 is higher than 8 kHz ．

11－02＝2：Soft PWM 2 control enables．User adjusts parameter 11－66（2 Phase／3 Phase PWM Switch Frequency）， 11－67（Soft PWM 2 Frequency Range）and 11－68（Soft PWM 2 Switch Frequency）by his／her own feeling to noise．

| $11-66$ | 2 Phase／3 Phase PWM Switch Frequency |
| :--- | :--- |
| Range | $【 6.00 \sim 60.00 】 \mathrm{~Hz}$ |

When the output frequency is higher than 11－66，the PWM mode will be switched．

| $11-67$ | Soft PWM 2 Frequency Range |
| :--- | :--- |
| Range | $【 0 \sim 12000 】$ |
| $11-68$ | Soft PWM 2 Switch Frequency |
| Range | $【 6.00 \sim 60.00 】$ |

When the output frequency is higher than 11－68，the noise detect function will be enabled，and according to 11－67 to modify the magnetic noise of motor．

## Note：

1．When $11-02=2$ ，estimator mode（22－26）and speed search mode selection（07－32）cannot be used at the same time．
2．When $11-02=2$ ，sum of $11-01$ and $11-67$ should be lower than the upper limit of carrier frequency． To avoid the error setting，please follow the rules listed as below．
－If error occurs when setting 11－01，it means 11－02＝2 and 11－01＋11－67＞Upper limit of carrier frequency， please reset 11－02 or 11－67．
－If error occurs when setting 11－67，it means 11－02＝2 and 11－01＋11－67＞Upper limit of carrier frequency， please reset 11－02 or 11－01．
－When 11－02＝2，if error occurs when setting 11－01 or 11－67，it means 11－01＋11－67＞Upper limit of carrier frequency，please reset the parameter．
－If error occurs when setting 11－02＝2，it means 11－01＋11－67＞Upper limit of carrier frequency，please reset the parameter 11－01 or 11－67，then set 11－02＝2．

| $11-03$ | Automatic carrier lowering selection |
| :---: | :--- |
| Range | $0:$ Disable <br> $1:$ Enable |

If inverter detects the overheating, the carrier frequency will decrease automatically. Once this temperature returns to normal, the carrier frequency will automatically return to the set value of 11-01.

11-03=0: Automatic carrier frequency reduction during an overheat condition is disabled.
Carrier frequency operation depends on the set value of 11-01.

11-03=1: Automatic carrier frequency reduction during an overheat condition is enabled.
Carrier frequency automatically decreases to reduce the heat loss and avoid the inverter's trip so as to extend the period of use in inverter when the heat sink temperature is higher than the sett value.

| $11-04$ | S curve time setting at the start of acceleration |
| :---: | :--- |
| $11-05$ | S curve time setting at the end of acceleration |
| $11-06$ | S curve time setting at the start of deceleration |
| $11-07$ | S curve time setting at the end of deceleration |
| Range | $0.00 \sim 2.50 \mathrm{Sec}$ |

The S curve function for acceleration / deceleration is used to reduce mechanical impact caused by the load during momentary starting and stopping of the inverter. To use the $S$ curve function set the time for acceleration start point (11-04), acceleration end point (11-05), deceleration start point (11-06) and deceleration end point (11-07). Refer to figure 4.4.86 for more information.

Figure 4.4.86 S curve characteristic

Total acceleration and deceleration time when the $S$ curve is used:
Accelerating time $=$ Accelerating time $1($ or 2$)+\frac{(11-04)+(11-05)}{2}$
Deceleration time $=$ Deceleration time $1($ or 2$)+\frac{(11-06)+(11-07)}{2}$

| 11-08 | Jump frequency 1 |
| :---: | :--- |
| $11-09$ | Jump frequency 2 |
| 11-10 | Jump frequency 3 |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| $11-11$ | Jump frequency width |
| :---: | :--- |
| Range | $0.0 \sim 25.5 \mathrm{~Hz}$ |

These parameters allow "jumping over" of certain frequencies that can cause unstable operation due to resonance within certain applications.

Note: Prohibit any operation within the jump frequency range. During acceleration and deceleration the frequency is continuous without skipping the jump frequency.

To enable jump frequency $1-3(11-08-11-10)$ set the frequency to a value greater than 0.0 Hz .
Use the jump frequency width (11-11) to create a jump frequency range. Refer to figure 4.4.87.

Figure 4.4.87 Jump frequency operation

## Jump frequency via Analog Input.

Set parameter 04-05 (AI2 function selection) to 9 (frequency jump setting 4) to control the jump frequency via analog input Al2. Refer to Figure 4.4.48.

Note: When jump frequency overlap the sum of the overlapped jump frequencies will be used as the jump frequency range. Refer to figure 4.4.88.

Figure 4.4.88 Jump frequency overlap

| $11-13$ | Automatic return time |
| :---: | :--- |
| Range | $0 \sim 120 \mathrm{sec}$ |

If the keypad is not pressed within the time specified in 16-06 (returning time of automatic back button), the keypad will automatically return to the mode screen.

When it is set to 0 , the automatic return function is off. Press the back button to return to the previous directory.

| $11-12$ | Manual energy saving gain |
| :---: | :--- |
| Range | $0 \sim 100 \%$ |

| $11-18$ | Manual energy saving frequency |
| :---: | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

Manual energy savings reduces the output voltage for the purpose of saving energy.
To enable manual energy savings set one of the multi-function digital input ( $03-00$ to $03-07$ ) to 20 and activate the input or use parameter 11-18 to set the manual energy savings activation frequency.

When the output frequency rises above the value set in parameter 11-18 manual energy savings function is enabled. Setting parameter $11-18$ manual energy savings frequency to 0.0 Hz disables the manual energy savings frequency activation function. Refer to figure 4.4.88 for more information.

Note: Only use manual energy savings functions in combination with light loads.
Manual energy saving gain (11-12) determines the output voltage of the inverter when manual energy savings is enabled. Output voltage is percentage gain times the V/F voltage.

Manual energy saving control uses the voltage recovery time (07-23) to change the output voltage

Figure 4.4.89 Manual energy saving operation

| $11-19$ | Automatic energy saving function |
| :---: | :--- |
| Range | 0: Automatic energy saving is disabled <br> 1: Automatic energy saving is enabled |

| $11-20$ | Filter time of automatic energy saving |
| :---: | :--- |
| Range | $0 \sim 200 \mathrm{msec}$ |

| 11-21 | Voltage upper limit of energy saving tuning |
| :---: | :--- |
| Range | $0 \sim 100 \%$ |

| 11-22 | Adjustment time of automatic energy saving |
| :---: | :--- |
| Range | $0 \sim 5000 \mathrm{msec}$ |

| Range | $0 \sim 100 \%$ |

| 11-24 | Coefficient of automatic energy saving |
| :---: | :--- |
| Range | $0.00 \sim 655.34$ |

In the V/F control mode the automatic energy saving (AES) function automatically adjusts the output voltage and reduces the output current of the inverter to optimize energy savings based on the load.

The output power changes proportional to the motor load. Energy savings is minimal when the load exceeds $70 \%$ of the output power and savings become greater when the load decreases.

The parameter of automatic energy saving function has been set at the factory before shipment. In general, it is no need to adjust. If the motor characteristic has significant difference from the TECO standard, please refer to the following commands for adjusting parameters:

## Enable Automatic Energy Savings Function

(1) To enable automatic energy saving function set 11-19 to 1.
(2) Filter time of automatic energy saving (11-20)
(3) Commissioning parameter of energy saving (11-21 to 11-22)

In AES mode, the optimum voltage value is calculated based on the load power requirement but is also affected by motor temperature and motor characteristic.

In certain applications the optimum AES voltage needs to be adjusted in order to achieve optimum energy savings. Use the following AES parameters for manual adjustment:

## 11-21: Voltage limit value of AES commissioning operation

Set the voltage upper limit during automatic energy saving. $100 \%$ corresponds to 230 V or 460 V or $575 / 690 \mathrm{~V}$ depending on the inverter class used. Refer to the figure 4.4.90.

Figure 4.4.90 Voltage limit value of commissioning operation
11-22: Adjustment time of automatic energy saving
Sets sample time constant for measuring output power.
Reduce the value of 11-22 to increase response when the load changes.
Note: If the value of 11-22 is too low and the load is reduced the motor may become unstable.

11-23: Detection level of automatic energy saving
Set the automatic energy saving output power detection level.
11-24: Coefficient of automatic energy saving
The coefficient is used to tune the automatic energy saving. Adjust the coefficient while running the inverter on light load while monitoring the output power. A lower setting means lower output voltage.

## Notes:

- If the coefficient is set to low the motor may stall.
- Coefficient default value is based on the inverter rating. Set parameter 13-00. If the motor power does not match the inverter rating.

| 11-29 | Auto De-rating Selection |
| :---: | :--- |
| Range | 0: Disable <br> 1: Enable |

The automatic de-rating function automatically reduces the output frequency by $30 \%$ of the nominal motor speed when the inverter detects an overheat condition (heatsink).

Automatic de-rating function depends on the automatic carried frequency reduction selection (11-03).
If automatic carrier frequency reduction is disabled (11-03=0), the output frequency is reduced by $30 \%$ of the nominal motor speed when an overheat condition is detected.

If automatic carrier frequency reduction is enabled (11-03=1), the output frequency is reduced by $30 \%$ of the nominal motor speed when the carrier frequency is at its minimum setting.

11-29=0: Auto de-rating selection disabled, carrier frequency is based on 11-01 or 11-03.
11-29=1: Auto de-rating selection is enabled.

| 11-30 | Variable Carrier Frequency Max. Limit |
| :---: | :--- |
| Range | $2 \sim 16 \mathrm{KHz}$ |

| 11-31 | Variable Carrier Frequency Min. Limit |
| :---: | :--- |
| Range | $1 \sim 16 \mathrm{KHz}$ |

| 11-32 | Variable Carrier Frequency Proportional Gain |
| :---: | :--- |
| Range | $00 \sim 99$ |

Carrier frequency method depends on the selected control mode.

| Control Mode | Variable Carrier Frequency <br> $(\mathbf{1 1 - 0 1}=\mathbf{0})$ | Fixed Carrier Frequency <br> $(\mathbf{1 1 - 0 1}=\mathbf{2 - 1 6 ~ k H z})$ |
| :--- | :---: | :---: |
| V/F and V/F +PG | Available | Available |
| SLV and SV | Not available | Available |

Variable carrier frequency can be adjust with parameter 11-30 ~ 11-32.

$K$ is a coefficient; the value of $K$ is based on the following based on the maximum carrier frequency:
$\mathrm{K}=1$ : when $11-30<5 \mathrm{KHz}$
$\mathrm{K}=2$ : when $10 \mathrm{KHz}>11-30 \geq 5 \mathrm{KHz}$
$\mathrm{K}=3$ : when $11-30 \geq 10 \mathrm{KHz}$

## Notes:

- In V/F and V/F + PG control mode if the speed and torque are constant, the variable carrier frequency mode (11-01=0) can be selected to reduce the carrier frequency based on output frequency.
- If the carrier frequency proportional gain (11-32) > 6 and 11-30 < 11-31, error message "SE01" out of range will appear on the keypad.
- If the minimum limit (11-31) is set higher than the maximum limit (11-30), the minimum limit will be ignored and the carrier frequency will be set at the highest limit (11-30).
- In fixed carrier frequency mode (11-01 = 2-16) parameters 11-30, 11-31 and 11-32 are not used.
- In SLV and SV control mode, the maximum limit of the carrier frequency is fixed at 11-30.

Overvoltage suppression is used for the application of likely causing to energy recharge.
Example: there are two situations causing excessive energy to recharge the inverter in stamping application
(1) When cam clutch is not engaged, the motor will accelerate and start flywheel. When motor decelerates, the rotation speed will higher than motor speed owing to the large flywheel's inertia and then recharge the inverter.
(2) When cam clutch is engaged, the motor will start flywheel and compress the spring. When the highest point of the cam moves beyond its center, the spring will release the power to the flywheel and excessive energy output recharge the inverter.

Figure 4.4.91 Stamping Operation

Over-voltage prevention (OVP) function monitors the DC-bus voltage and adjusts the speed reference, acceleration and deceleration rate, to prevent the inverter from tripping on an overvoltage.

When the speed reference is reduced, the motor will start to decelerate. When the inverter is operating at a fixed output frequency and excessive regenerative energy back to the inverter is detected the inverter will accelerate the motor in order to reduce the DC-bus voltage. Refer to figure 4.4.92.

Figure 4.4.92 OVP operation

## When 11-40=1: OV prevention Mode 1

1) DC voltage filter is used to provide a stable reference value for determining the change in DC voltage change during regenerative operation.

- Adjust the DC voltage filtering increase rate parameter 11-33 (DC Voltage Filter Rise Amount). When the DC voltage exceeds 11-33+11-35 (DC Voltage Filter Deadband Level), the output of the filter will increase.
- Adjust the DC voltage filtering decrease rate parameter 11-34 (DC Voltage Filter Fall Amount). When the DC voltage exceeds 11-33+11-35 (DC Voltage Filter Deadband Level), the output of the filter will decrease.
- Monitor the DC voltage filter output by 12-20 (DC voltage filter value).
- Set the DC voltage filter decrease rate (11-34) to a greater value than the value of the DC voltage filtering increase rate (11-33).

2) When the inverter is operation at a fixed output frequency, the OVP function will monitor the DC-bus voltage to detect regenerative operation.

In case of a regenerative condition the inverter calculates the delta DC bus voltage value and multiplies the value with parameter 11-36, the result is added to the frequency reference accelerating the motor to prevent on an overvoltage condition.

When the regenerative energy decreases, the inverter output frequency will return to the actual frequency reference. Deceleration rate is based on the DC voltage, as shown in Figure 4.4.93.

Figure 4.4.93 OVP deceleration time
3) When the inverter is stopped, the deceleration rate can be set with parameter 00-15 (Tdec1). In case the DC voltage is too high, the inverter will decelerate based on the OVP deceleration time as shown in Figure 4.4.92.

- Set DC-bus voltage in parameter 11-38 (start voltage of OVP deceleration) and set OVP deceleration rate in 00-22 (Tdec3).
- When the DC voltage reaches this level, it is necessary to decelerate rapidly in order to prevent the delta DC voltage of becoming too large.
- When DC voltage reaches the setting of 11-39 (stop voltage of OVP deceleration), it will decelerate based on the set value of 00-24 (Tdec4)
- Deceleration rate is linear based on the slope defined by the start point (11-38) and end point (11-39).
4). Enable the OVP function with parameter $11-40$ set to 1 or 2 . The following parameter default values will be changed when the OVP function is enabled:
$00-14($ Tacc1) $=5.0 \mathrm{Sec}($ the frequency reference acceleration rate when DC voltage is too high.)
$00-22$ (Tdec3) $=20.0 \mathrm{Sec}$ (low setting point of OVP deceleration rate).
$00-24($ Tdec 4$)=100.0 \mathrm{Sec}$ (high setting point of OVP deceleration rate).
Note: S curve should be disabled when using the OVP function (11-04~11-07=0.0sec).
When 11-40=2: OV prevention Mode 2

The process of OV prevention mode 2 is the same as that of OV prevention mode 1 but it strengthens more the part of DC BUS over the deceleration stop voltage of OV prevention (11-39) in Fig.4.4.92. It can accelerate frequency compensation to avoid OV protection by increasing frequency gain of OV prevention 2 (11-28).

When 11-40=3: OV prevention Mode 3
$\mathrm{T}=$ The inverter raise the output frequency temporarily to avoid OV, the output frequency wont higher than the value of 01-02 (Maximum Output Frequency of Motor 1). Please adjust the value of 01-02 according to application. If it still occur OV in 11-40=3, please raise the value of 11-64 in 0.1 unit.

| $11-64$ | Acceleration Speed Gain Adjustment |
| :--- | :--- |
| Range | $0.1 \sim 10.0$ |

It will influence the speed and current if the value of 11-64 is too high.

| $11-65$ | Target Main Circuit Voltage |
| :--- | :--- |
|  | $200 \mathrm{~V}: 200 \mathrm{~V} \sim 400 \mathrm{~V}$ |
| Range | $400 \mathrm{~V}: 400 \mathrm{~V} \sim 800 \mathrm{~V}$ |
|  | $575 \mathrm{~V}: 520 \mathrm{~V} \sim 1040 \mathrm{~V}$ |
|  | $690 \mathrm{~V}: 624 \mathrm{~V} \sim 1248 \mathrm{~V}$ |

| $11-41$ | Reference frequency loss detection |
| :---: | :--- |
| Range | 0: when reference frequency disappears, the deceleration will stop. <br> 1: when reference frequency disappears, continue to operate according to the proportion of <br> reference frequency $\times 11-42$. |

| $11-42$ | Reference frequency loss level |
| :---: | :--- |
| Range | $0.0 \sim 100.0 \%$ |

A Reference frequency loss is detected when the frequency command falls $90 \%$ within 360 ms .
The action performed when a reference loss is detected is set with parameter 11-41.
11-41=0: Inverter will decelerate to a stop when a reference loss is detected.
11-41=1: Inverter will continue to operate; reference frequency is the value of Maximum Output Frequency of Motor 1 x the level set in parameter 11-42.

The inverter will return to normal operation when:
(1) The reference frequency is restored while running and the reference level exceeds $80 \%$ of the master frequency command.
(2) Stop command is issued.

## Notes:

- Reference frequency loss level (11-42) is corresponding to the maximum output frequency of Motor 1(01-02).
- Reference frequency loss level is used in the analog signal (1: AI1 or 7: AI2) from the selection of main frequency source (00-05).

Refer to the following Fig. 4.4.94 for the operation diagram of multi-function digital output (03-11~03-12) when the analog frequency command is in the loss of frequency command.

Figure 4.4.94 Operation in reference frequency loss

| 11-43 | Hold frequency at start |
| :---: | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| $11-44$ | Frequency hold time at start |
| :---: | :--- |
| Range | $0.0 \sim 10.0 \mathrm{Sec}$ |

| $11-45$ | Hold frequency at stop |
| :---: | :--- |
| Range | $0.0 \sim 599.0 \mathrm{~Hz}$ |

| $11-46$ | Frequency hold time at stop |
| :---: | :--- |
| Range | $0.0 \sim 10.0 \mathrm{Sec}$ |

The hold function is used to temporarily hold the reference frequency in order to prevent stalling the motor or preventing an over current condition during starting or stopping due to load conditions.

During start the inverter will operate at the hold frequency at start for the time specified in the parameter 11-44 in order to establish the magnetic flux.

Note: The acceleration of deceleration time does not include the start and stop hold time. Refer to the figure 4.4.95.

Figure 4.4.95 Reserved function
When the inverter is in stop mode, this function can also be used to prevent wind milling. In addition, it can be used for the purpose of braking using the motor to consume the braking energy resulting in a better controlled stop. Refer to the DC brake parameter 07-16 for DC braking during start.

## Notes:

- The hold function at start is inactive when the hold frequency at start (11-43) is set to a value less than Fmin (01-08).
- The hold function at stop is inactive when the hold frequency at stop (11-45) is set to a value less than Fmin (01-08).

| $11-47$ | KEB Deceleration time |
| :--- | :--- |
| Range | $0.0 \sim 25.5 \mathrm{Sec}$ |

| $\mathbf{1 1 - 4 8}$ | KEB detection level |
| :---: | :--- |
| Range | $200 \mathrm{~V}: 190 \sim 210 \mathrm{~V}$ |
|  | $400 \mathrm{~V}: 380 \sim 420 \mathrm{~V}$ |
|  | $575 \mathrm{~V}: 540 \sim 570 \mathrm{~V}$ |
|  | $690 \mathrm{~V}: 540 \sim 684 \mathrm{~V}$ |

KEB function can be used to keep the inverter from tripping on a under voltage condition due to a momentary power-loss. To enable the KEB function set parameter 11-47 to a value greater than 0.0 sec .

Upon detection of a power-loss the inverter uses the KEB deceleration time (11-47) to decelerate the motor and using the regenerative energy from the motor to maintain the DC-bus at a nominal level.

## 11-48: KEB detection level

If the DC-bus voltage falls below the value set in 11-48, the KEB is activated and the inverter starts decelerating according to the value set in 11-47.

To accelerate back to the original output frequency one of the digital inputs (03-00 to 03-07) set for 48 (KEB acceleration) has to be activated and the DC voltage has to rise above 11-48 + delta V (Delta $\mathrm{V}=+10 \mathrm{~V}$ for 230 V series, Delta $\mathrm{V}=+20 \mathrm{~V}$ for 460 V Series, Delta $\mathrm{V}=+26 \mathrm{~V}$ for 575 V Series, Delta $\mathrm{V}=+30 \mathrm{~V}$ for 690 V Series).

Refer to the example in Figure 4.4.96.

Figure 4.4.96 KEB operation

| 11-49 | Zero-servo gain |
| :--- | :--- |
| Range | $0.01 \sim 5.00$ |

| $\mathbf{1 1 - 5 0}$ | Zero-servo count |
| :--- | :--- |
| Range | $0 \sim 4096$ |

| $\mathbf{1 1 - 5 1}$ | Braking selection of zero-speed |
| :---: | :--- |
| Range | 0: Zero-speed DC braking is disabled <br>  <br> 1: Zero-speed DC braking is enabled |

When the motor is stopped, the zero-servo function is used to maintain the motor shaft position in SV control mode.

Refer to the figure 4.4.97 for zero servo operation.

Figure 4.4.97 Zero servo operation

- Use one of multi-function digital inputs (03-00 to 03-07) set to 46 to execute the zero-servo command.
- If the frequency reference is lower than the zero speed level (the larger of 01-08 or 07-06 (DC braking start frequency)), zero servo operation is active (zero servo start position) and the motor shaft will remain in the same position even if the analog reference signal level is greater than 0.
- Deactivating multi-function input set for zero-servo, deactivates the zero-servo operation.
- Use multi-function digital outputs (03-11, 03-12 = 31) for zero-servo completed indication.
- Zero-servo count 11-50 is used when one of multi-function digital outputs is set to 31 (zero-servo completed).
- Zero-servo completion is enabled when the motor shaft position count falls within the zero-servo starting position $\pm$ servo counts set in parameter 11-50.
- Zero-servo or normal operation command is active when zero-servo completion signal is turned off.

11-49: Zero-servo gain setting
Use the zero-servo gain parameter 11-49 to adjust the holding torque in zero-servo operation. If the set value is increased, the holding torque will increase but instability may occur.
When $11-49$ is set to 1 , if 1 circle of position error occurs, 1 rated motor speed will occur.
Do not use the zero-servo function at $100 \%$ of the inverter rated current as this may cause the inverter to overheat (OH1). Zero-servo may permanently be used to maintain $50-60 \%$ of the inverter rated current. Increase inverter rating if more is required.

11-50: Zero-servo count

Zero servo count is used to specify the zero-servo position offset from the zero-servo start position used for zero-servo completion.

11-51: Operation selection of zero-speed braking
In V/F control mode, the DC braking operation (without PG feedback) can be used to the motor shaft.
Set 11-51 to select zero-speed braking operation to 1 to enable this function.
To use DC braking operation set parameter 00-02 (operation command selection) to 1 and parameter 00-05 (frequency reference selection) to 1, the operation command and frequency reference are now set for external control. When the frequency reference is 0 V (or less than 4 mA ), and the operation command is turned on, the zero-speed ' $D C$ ' braking operation is activated and holding torque is generated using DC braking.

Refer to Figure 4.3.98 for more information on zero-speed DC braking operation.
Note: DC braking 07-07 is limited to $20 \%$ of the inverter rated current.

Figure 4．4．98 Zero－speed braking operation

| $11-52$ | Droop control level |
| :--- | :--- |
| Range | $0.0 \sim 100.0 \%$ |
|  |  |
| $11-53$ | Droop control delay |
| Range | $0.01 \sim 2.00 \mathrm{Sec}$ |
|  |  |
| $11-76$ | Droop frequency level 1 |
| Range | 【0．00～599．00】 Hz |
| $11-77$ | Droop frequency level 2 |
| Range | 【0．00～599．00】 Hz |
| $11-78$ | Droop torque offset value |
| Range | 【0．00～100．00】\％ |

Droop control is used for load balancing when using two standard AC motors to drive the load in applications such as cranes and conveyors．When droop control is active the inverter reduces the speed when the torque reference rises and increases the speed when the torque reference drops．
（a）Load balancing using the standard AC motors．
The load torque of motor $A, T A>$ The load torque of motor $B, T B$ ．
（b）Load balancing using high slippage AC motors．
The load torque of motor A ，TA is very close to the load torque of motor B，TB．

- Droop function can be used to approximate the characteristic of a high slippage motor. Set 11-52 to the percentage of the speed reduction that amounts to $100 \%$ of motor torque based on the maximum frequency (01-02).
- Droop function is disabled when $11-52$ is set to $0.0 \%$.

11-53: Droop control delay
This setting is used adjust the response speed of the droop function. Increase value in case of current oscillation.
-Parameter 11-76 and 11-77 can be used to set the Droop Function starting operations when reaching the set frequency, the Speed Gain Adjustment Curve is shown in the Figure below.

-Parameter 11-78 can be used to set the Droop Function starting operations when reaching the set Torque Offset Value, the Torque Command Adjustment Curve is shown in the Figure below.

| 11-54 | Output KWHr initialization |
| :---: | :--- |
| Range | 0: Do not clear output KWHr <br> 1: Clear output KWHr |

Reset kW-hour meter (12-40).

| 11-55 | STOP key selection |
| :---: | :--- |
| Range | 0: Stop key is disabled when the operation command is not provided by operator. <br>  <br> 1: Stop key is enabled when the operation command is not provided by operator. |

11-55 $=0$ : Stop button disabled when operation command is set for terminals ( $00-02=1$ ) or communication (00-02=3).
11-55= 1: Stop button enabled

| $11-56$ | UP/DOWN selection |
| :---: | :--- |
| Range | 0: UP/DOWN reference frequency adjustment with ENTER key. <br> 1: UP/DOWN reference frequency adjustment without ENTER key. |

11-56= 0: Changing the reference frequency on the keypad in UP/DOWN control requires the ENTER button to be pressed for the inverter to accept the modified reference frequency.

11-56= 1: Changing the reference frequency on the keypad in UP/DOWN control immediately changes the reference frequency and there for the output frequency.

Note: The reference frequency can be changed (up or down) via the keypad or by setting one of multi-functional digital input terminals (03-00, 03-07) to 8 and 9 . Refer to instructions of (03-00-03-07 = 8 or 9 ).

| $11-58$ | Record reference frequency |
| :---: | :--- |
| Range | $0:$ Disable <br> 1: Enable |

This function is enabled only when one of multi-function digital input terminals ( $03-00$ to $03-07$ ) is set to 11 (Inhibit ACC / DEC command).

11-58= 0 : When ACC / DEC inhibition command is enabled, the motor will stop accelerate or decelerate, and the frequency at the moment will be used as frequency command. If ACC / DEC inhibition command is disabled or stop command enabled, the frequency command will set to original frequency.
Besides, when stop command enabled, or the power is cut off and reset. The frequency will be set to 0 Hz
Note: If ACC / DEC inhibition command is enabled before running, it will display STPO after running, due to there is no reference frequency record.

11-58= 1: When ACC / DEC inhibition command is enabled, the output frequency will be recorded and to be used as frequency command. When it switches to stop or the power is cut off and reset, the ACC / DEC inhibition command is still enabled, the frequency command is still recorded and the frequency command is set to the frequency that was recorded.

Please refer to the following figure.

| $11-59$ | Gain of Preventing Oscillation |
| :--- | :--- |
| Range | $0.00 \sim 2.50$ |

It is used to adjust preventing oscillation function.
If the oscillation in driving motor occurs at normal duty, it is required to increase the setting value gradually in the unit of 0.01 .

| $11-60$ | Upper Limit of Preventing Oscillation |
| :--- | :--- |
| Range | $0 \sim 100 \%$ |

It is required to limit the preventing oscillation upper limit within the setting value.

| $11-61$ | Time Parameter of Preventing Oscillation |
| :--- | :--- |
| Range | $0 \sim 100$ |

Adjust the response of oscillation function. (Time parameter of adjust preventing oscillation function delay.)

| 11-62 | Selection of Preventing Oscillation |
| :--- | :--- |
| Range | 0: Mode 1 |
|  | 1: Mode 2 |
|  | 2: Mode 3 |

When 11-62=0 and 1: Mode 1 and 2, the response to preventing oscillation is slower.
When 11-62=2: Mode 3, the response to preventing oscillation is faster.

| $11-63$ | Strong Magnetic Selection |
| :---: | :--- |
| Range | $0:$ Disable <br> $1:$ Enable |

11-63=0: It has no function of flux-strengthening, the no-load current of high speed and low speed are the same.
11-63=1: It has function of flux-strengthening, the torque of low speed is higher, but the no-load current is also higher, it is suitable for big load in low speed.

| $11-69$ | Gain of Preventing Oscillation 3 |
| :---: | :--- |
| Range | $0.00 \sim 200.00 \%$ |

Adjust the response of Gain of Preventing Oscillation 3
If occur vibration with motor in ND mode, please increase by 0.01 unit to set.

| $11-70$ | Upper Limit of Preventing Oscillation 3 |
| :---: | :--- |
| Range | $0.01 \sim 100.00 \%$ |

It is required to limit the preventing oscillation 3 upper limit within the setting value.

| 11-71 | Time Parameter of Preventing Oscillation 3 |
| :---: | :--- |
| Range | $0 \sim 30000 \mathrm{~ms}$ |

Adjust the response of oscillation 3 function. (Time parameter of adjust preventing oscillation function delay.)

| 11-72 | Gain of Preventing Oscillation for switch frequency 1 |
| :--- | :--- |
| Range | $0.01 \sim 300.00 \mathrm{~Hz}$ |
|  |  |
| Range | Gain of Preventing Oscillation for switch frequency 2 |

## 12－Monitoring Parameters

| 12－00 | Display screen selection（LED） |
| :--- | :--- |
|  | Highest bit $=>\quad \underline{0} \underline{0} \underline{0} \underline{0} \underline{0} \quad<=$ lowest bit |
|  | The value range of each bit is $0 \sim 7$ from the highest bit to the lowest bit， |
|  | 0：No display |
| Range | 1：Output current |
|  | 2：Output voltage |
|  | 3：DC bus voltage |
|  | 4：Heatsink temperature |
|  | 5：PID feedback |
|  | 6：Al1 value |
|  | 7：Al2 value |

Note：The highest bit is used for power－up monitor．The 4 least significant bits can be used to customize the display sequence see chapter 4．1．3．

| 12－01 | PID feedback display mode（LED） |
| :---: | :--- |
| Range | 0：Display the feedback value in integer（ xxx ） <br> 1：Display the feedback value with one place after the decimal point（ $\mathrm{xx} . \mathrm{x}$ ） <br> 2：Display the feedback value（ $\mathrm{x} . \mathrm{xx}$ ）with two places after the decimal point |

| 12－02 | PID feedback display unit setting（LED） |
| :---: | :--- |
| Range | $0: \times x x x x$（no unit） <br>  <br>  <br>  <br> 1： xxxPb （pressure） <br> 2： xxxFL （flow） |

When $12-00=x x x 5$ ，LED preset screen will display PID feedback．Parameter 12－01 will refer to the value of 10－33 and display five－digit XXX．XX．
For example，
When $10-33=9999$ ，preset screen of $12-01=0$ will display $99,12-01=1$ will display 99.9 ，and $12-01=2$ will display 99.99.

If setting of $12-02$ is also referred， $12-01=1$ and $12-02=1$ will display five－digit $99.9 \mathrm{~Pb} ; 12-01=2$ and $12-02=2$ will display $9.99 F L$ and decimal 9 will be hidden．

| $12-03$ | Line Speed Display（LED） |
| :--- | :--- |
| Range | 【0～60000】 RPM |
| $12-04$ | Line Speed Display Mode（LED） |
|  | 【0】 ：Display Inverter Output Frequency |
|  | 【1】 ：Line Speed Display at Integer．（xxxxx） |
| Range | 【2】 ：Line Speed Display at One Decimal Place．（xxxx．x） |
|  | 【3】 ：Line Speed Display at Two Decimal Places．（xxx．xx） |
|  | 【4】：Line Speed Display at Three Decimal Places．（xx．xxx） |

12－04＝0
Inverter displays the line speed at stop，operation or the modification of frequency．
12－04キ0

12－03 is set to the maximum line speed and corresponds to the maximum output frequency．
For example，if the line speed display of $12-03$ is 1800 ，the keypad display is 900 when frequency output is 30 Hz ．

| $12-05$ | Status display of digital input terminal (LED / LCD) |
| :---: | :--- |
| Range | Read-only |

Terminals S1-S8 are represented using two segments of each digit. Segment turns on when input is active. The bottom segments of each of the first three digits are used to represent the digital outputs (R1, R2, DO1). Segments turn on when output is active.

Example1: S1~S8, R1, R2 and DO1 are ON

Note: Refer to section 4.3 for monitors 12-11~12-64.
Monitoring parameter 12-34: Only for JN5-PG-L, JN5-PG-O, JN5-PG-PM optional card and manual pulse generator (MPG) function.
Monitoring parameter12-66: Encoder Angle
Encoder PG pulse (20-27) is set to correct connection with the encoder wiring. Make the motor rotate forwardly at non-run state and the angle will accumulate to $360^{\circ}$ at two times; if make the motor rotate reversely, the angle will regress to $360^{\circ}$ at two times.

Monitoring parameter 12-67: Cumulative Energy (KWHr) \& 12-68: Cumulative Energy (MWHr)

Initialization of Cumulative Energy of 11-54 can clear these monitoring parameters.
Monitoring parameter 12-38: PID setting \& 12-39: PID Feedback

Refer to the setting of 10-33~10-35.

## Monitoring parameter 12-76: No-Load Voltage Output

It is required to be with the descriptions of parameter 02-09 (excitation current of motor 1) and parameter 17-09 (motor excitation current).

## Monitoring parameter 12-78: Z-Phase Bias Value

It is required to be with the parameter 21-43 (Offset Angle).
Monitoring parameter 12-79: Pulse Input Percentage
Refer to parameter 03-30 (Selection of pulse input)
Note: It can perform run command when viewing monitoring parameters (12-05~12-82).

| :---: | :--- |
| Range | $0 \sim 65534$ days |

When $13-02=1$, time set of $13-03 / 13-04$ will be deleted.

| $13-05$ | Selection of cumulative operation time |
| :---: | :--- |
| Range | 0: Accumulative operation time while power on <br> $1:$ Accumulative operation time when it is operating. |

13-05= 0: Inverter logs the time while the inverter is powered-up.
13-05= 1: Inverter logs the time when the inverter is running.

| 13-06 | Parameters lock |
| :--- | :--- |
| Range | 0: Parameters are read-only except 13-06 and main frequency |
|  | 1: Only User Defined Parameters |
|  | 2: All parameters are writable |

When 13-06=0, only parameter 13-06 and frequency command parameter in main screen can be set but other parameters are read-only.

When $13-06=1$, only user parameters (00-41~00-56) are enabled. Please refer to the instruction of parameters 00-41~00-56.

Note: it is only enabled in LCD keypad.
When $13-06=2$, all parameters are writable except for the read-only parameters.
Note:
Main frequency setting is 12-16. The value is equal to frequency setting of speed-stage 0 (05-01) in LCD keypad. LED Main Frequency can beset in the main frequency display

| $13-07$ | Parameter Lock Key Code |
| :--- | :--- |
| Range | 【00000~65534】 |

$>$ When parameter lock key code is enabled (13-07>0), all parameter except main frequency can't be modified. Only unlock the key code, modify the parameters is allowable.
> Setting parameter lock key number example:
Step 1

Step 2:

Lifting lock key code (password):

| 13-08 | Restore factory setting / Initialize |
| :---: | :---: |
| Range | 0 : No initialization <br> 2 : 2 wire initialization $(60 \mathrm{~Hz})$ <br> (230V/460V/690V) <br> $3: 3$ wire initialization ( 60 Hz ) <br> (230V/460V/690V) <br> $4: 2$ wire initialization $(50 \mathrm{~Hz})$ <br> (230V/415V) <br> $5: 3$ wire initialization $(50 \mathrm{~Hz})$ <br> (230V/415V) <br> $6: 2$ wire initialization $(50 \mathrm{~Hz})$ <br> (200V/380V/575V) <br> 7 : 3 wire initialization ( 50 HZ ) <br> (200V/380V/575V) <br> 8 : PLC initialization <br> $9: 2$ wire Initialization $(60 \mathrm{~Hz})$ (230V/460V) <br> $10: 3$ wire Initialization $(60 \mathrm{~Hz})$ ( $230 \mathrm{~V} / 460 \mathrm{~V}$ ) <br> $11: 2$ wire Initialization $(60 \mathrm{~Hz})(230 \mathrm{~V} / 400 \mathrm{~V})$ <br> $12: 3$ wire Initialization $(60 \mathrm{~Hz})(230 \mathrm{~V} / 400 \mathrm{~V})$ <br> $13: 2$ wire Initialization $(50 \mathrm{~Hz})(230 \mathrm{~V} / 400 \mathrm{~V})$ <br> $14: 3$ wire Initialization $(50 \mathrm{~Hz})(230 \mathrm{~V} / 400 \mathrm{~V})$ <br> $15: 2$ wire Initialization $(220 \mathrm{~V} / 380 \mathrm{~V}, 50 \mathrm{~Hz})$ <br> $16: 3$ wire Initialization ( $220 \mathrm{~V} / 380 \mathrm{~V}, 50 \mathrm{~Hz}$ ) |

Use parameter 13-08 to initialize the inverter to factory default. It is recommended to write down the modified parameters before initializing the inverter. After initialization, the value of 13-08 will return to zero automatically.

13-08=2: 2-wire initialization $(60 \mathrm{~Hz})(220 \mathrm{~V} / 440 \mathrm{~V} / 690 \mathrm{~V})$
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. Inverter input voltage (01-14) is automatically set to 220 V ( 200 V class) or 440 V (400V class) or 690 V ( 660 V class).

When 01-00V/Curve $=F, 01-02$ will automatically set to 60 Hz .
13-08=3: 3-wire initialization $(60 \mathrm{~Hz})(220 \mathrm{~V} / 440 \mathrm{~V} / 690 \mathrm{~V})$
Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3-wire start operation and stop command. Refer to Figure 4.4.2 and Figure 4.4.3 for 3-wire type operation mode. Inverter input voltage (01-14) is automatically set to 220 V (200V class) or 440 V ( 400 V class) or 690 V ( 660 V class).

When 01-00V/Curve $=F, 01-02$ will automatically set to 60 Hz .
13-08=4: 2-wire initialization (50Hz) (230V/415V)

Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. Inverter input voltage (01-14) is automatically set to 230V (200V class) or 415 V (400V class).

When 01-00V/Curve $=F, 01-02$ will automatically set to 50 Hz .
13-08=5: 3-wire initialization ( 50 Hz ) ( $230 \mathrm{~V} / 415 \mathrm{~V}$ )
Multi-function digital input terminal S5 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Inverter input voltage (01-14) is automatically set to 230 V ( 200 V class) or 415 V ( 400 V class).

When $01-00 \mathrm{~V} /$ Curve $=\mathrm{F}, 01-02$ will automatically set to 50 Hz .
$13-08=6$ : 2 -wire initialization $(50 \mathrm{~Hz})(200 \mathrm{~V} / 380 \mathrm{~V} / 575 \mathrm{~V})$
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. Inverter input voltage (01-14) is automatically set to 200 V (200V class) or 380 V ( 400 V class) or 575 V ( 660 V class).

When 01-00V/Curve= F , 01-02 will automatically set to 50 Hz .
13-08=7: 3 -wire initialization $(50 \mathrm{~Hz})(200 \mathrm{~V} / 380 \mathrm{~V} / 575 \mathrm{~V})$
Multi-function digital input terminal S5 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Inverter input voltage (01-14) is automatically set to 200 V ( 200 V class) or 380 V ( 400 V class) or 575 V ( 660 V class).

When $01-00 \mathrm{~V} /$ Curve $=\mathrm{F}, 01-02$ will automatically set to 50 Hz .
13-08=8: PLC initialization
Clear built-in PLC ladder logic and related values.
13-08=9: 2 wire Initialization ( 60 Hz ) ( $230 \mathrm{~V} / 460 \mathrm{~V}$ )
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. Inverter input voltage (01-14) is automatically set to 230 V (200V class) or 460 V ( 400 V class).

When 01-00V/Curve= $\mathrm{F}, 01-02$ will automatically set to 60 Hz .
$13-08=10$ : 3 wire Initialization ( 60 Hz ) (230/460V)
Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Refer to Figure 4.4 .2 and Figure 4.4 .3 for 3 -wire type operation mode. Inverter input voltage (01-14) is automatically set to 230 V ( 200 V class) or 460 V ( 400 V class).

When 01-00V/Curve $=F, 01-02$ will automatically set to 60 Hz .

13-08=11: 2 wire Initialization ( 60 Hz ) (230/400V)
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. Inverter input voltage ( $01-14$ ) is automatically set to 230 V ( 200 V class) or 400 V ( 400 V class).

When 01-00V/Curve= $\mathrm{F}, 01-02$ will automatically set to 60 Hz .
13-08=12: 3 wire Initialization ( 60 Hz ) (230/400V)

Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Refer to Figure 4.4.2 and Figure 4.4.3 for 3-wire type operation mode. Inverter input voltage ( $01-14$ ) is automatically set to 230 V ( 200 V class) or 400 V ( 400 V class).

When 01-00V/Curve $=\mathrm{F}, 01-02$ will automatically set to 60 Hz .

13-08=13: 2 wire Initialization ( 50 Hz ) (230/400V)
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Figure 4.4.1. Inverter input voltage (01-14) is automatically set to 230 V (200V class) or 400 V ( 400 V class).

When $01-00 \mathrm{~V} /$ Curve $=\mathrm{F}, 01-02$ will automatically set to 50 Hz .
$13-08=14: 3$ wire Initialization (50Hz) (230/400V)
Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Refer to Figure 4.4 .2 and Figure 4.4 .3 for 3 -wire type operation mode. Inverter input voltage (01-14) is automatically set to 230 V ( 200 V class) or 400 V ( 400 V class).

When 01-00V/Curve= $\mathrm{F}, 01-02$ will automatically set to 50 Hz .
13-08=15: 2 wire initialization ( $220 \mathrm{~V} / 380 \mathrm{~V}, 50 \mathrm{~Hz}$ )
Multi-function digital input terminal S1 controls forward operation / stop command, and S2 controls reverse operation / stop command. Refer to Fig.4.4.1. The input voltage ( $01-14$ ) will be set to 220 V ( 200 V class) or 380 V ( 400 V class) automatically and when $01-00$ (V/F curve) is set to $F$, the maximum frequency of $01-12$ will be set to 50 Hz automatically.
$13-08=16$ : 3 wire initialization $(220 \mathrm{~V} / 380 \mathrm{~V}, 50 \mathrm{~Hz}$ )
Multi-function digital input terminal S7 controls the forward / reverse direction, and terminals S1 and S2 are set for 3 -wire start operation and stop command. Refer to Figure 4.4.2 and Figure 4.4.3 for 3 -wire type operation mode. The input voltage ( $01-14$ ) will be set to 220 V ( 200 V class) or 380 V ( 400 V class) automatically and when 01-00 (V/F curve) is set to F , the maximum frequency of $01-12$ will be set to 50 Hz automatically.

Parameters don't be influenced by restore factory setting / Initialize (13-08)

| No. | Parameters |

## 16-LCD Function group

| 16-00 | Main screen monitoring |
| :--- | :--- |
| Range | $5 \sim 82$ |

| 16-01 | Sub-screen monitoring 1 |
| :--- | :--- |
| Range | $5 \sim 82$ |

| 16-02 | Sub-screen monitoring 2 |
| :--- | :--- |
| Range | $5 \sim 82$ |

At power-up the inverter shows two monitor section on the display, main monitor section and the sub-screen monitor section (smaller font).

Choose the monitor signal to be displayed as the main-screen monitor screen in parameter 16-00, and the monitor signals to be displayed on the sub-screen monitor in parameters 16-01 and 16-02, similar to monitor parameters 12-5 ~ 12-82.

| 16-03 | Display unit |
| :---: | :--- |
|  | 0: Frequency display unit is Hz (Resolution is 0.01 Hz ) |
|  | 1: Frequency display unit is \% (Resolution is $0.01 \%$ ) |
|  | 2: Frequency display unit is rpm. |
| Range | 3~39: Reserved |
|  | 40~9999: $100 \%$ is XXXX with no decimals (integer only) |
|  | 10001~19999: $100 \%$ is $\mathrm{XXX} . \mathrm{X}$ with 1 decimal |
|  | 20001~29999: $100 \%$ is $\mathrm{XX.XX}$ with 2 decimals |
|  | 30001~39999: $100 \%$ is $X . X X X$ with 3 decimals |

| 16-04 | Engineering unit |  |
| :---: | :---: | :---: |
| Range | 0: No Unit |  |

|  | $\begin{aligned} & 00040 \\ & - \\ & 09999 \end{aligned}$ | - | use 16-04 setting | Example: 100 \% speed is 0200 $>$ set 16-03=00200 (from 05-01, 06-01 to 06-15, set range from 0040 to 9999). <br> $>$ set 16-04=0 (no unit) |
|  | $\begin{aligned} & 10001 \\ & - \\ & 19999 \end{aligned}$ | 므․ . |  | Example: 100 \% speed is 200.0 CFM <br> > set 16-03=12000 (05-01, 06-01 to 06-15, set range from 0000 to 9999). <br> > set 16-04=2 (CFM) <br> $>60 \%$ speed will be displayed as 120.0 CFM |
|  | $\begin{aligned} & 20001 \\ & - \\ & 29999 \end{aligned}$ | ㅁ. 믐 |  | ```Example: \(100 \%\) speed is \(65.00^{\circ} \mathrm{C}\) \(>\) set 16-03=26500 (05-01, 06-01 to 06-15, set range from 0000 to 9999) \(>\) set 16-04=20 ( \({ }^{\circ} \mathrm{C}\) ) \(>60 \%\) of speed is displayed as \(39.00{ }^{\circ} \mathrm{C}\)``` |
|  | $\begin{aligned} & 30001 \\ & - \\ & 39999 \end{aligned}$ | ㅁ. 믐 |  | $\begin{aligned} & \text { Example: } 100 \% \text { speed is } 2.555 \mathrm{~m} / \mathrm{s} \\ & >\text { set } 16-03=32555 \\ & >\text { set } 16-04=14(\mathrm{~m} / \mathrm{s}) \\ & >60 \% \text { speed is displayed as } 1.533 \mathrm{~m} / \mathrm{s} \end{aligned}$ |

| 16-05 | LCD backlight |
| :---: | :--- |
| Range | $0 \sim 7$ |

Adjust the screen contrast of the digital operator. If it is set to 0 , the screen backlight is turned off.

| $\mathbf{1 6 - 0 7}$ | Copy function selection |
| :--- | :--- |
| Range | 0: Do not copy parameter |
|  | 1: Read inverter parameters and save to the keypad |
|  | 2: Write the keypad parameters to inverter |
|  | 3: Compare parameters of inverter and keypad |

| $16-08$ | Selection of allowing reading |
| :---: | :--- |
| Range | 0: Do not allow to read inverter parameters and save to the keypad <br> $1:$ Allow to read inverter parameters and save to the keypad |

LCD digital operator with built-in memory (EEPROM) can be used to store and retrieve parameters:
(1) Read: Save inverter parameters to the digital operator (INV $\rightarrow$ OP).
(2) Write: Write the parameters from the digital operator to the inverter and save (OP $\rightarrow$ INV).
(3) Verify: Compare the inverter parameters against the parameters in the digital operator.

16-07=0: No action
16-07=1: Read (all parameters are copied from the inverter to the keypad).
16-07=2: Write (all parameter are copied from the keypad to the inverter).
16-07=3: Verify (Compare the set value of the inverter to the parameter of the digital operator).
Set 16-08 $=0$, to prevent the saved parameter data stored in the digital operator from accidentally being overwritten.

When parameter $16-08=0$ and the read operation is executed (16-07=1) a warning message of "RDP Read Prohibited" will be displayed on the keypad and the read operation is cancelled.

Refer to the following steps for copy function operation.
For the write-in operation requires the following items to match.
(1) Inverter type
(2) Inverter rated capacity and voltage

## Note:

1. Inverter in V1.20 version or the above will support the data in older version written in newer version. If the version switch is completed, the power supply is restarted.
2. Data copy is not limited by parameter 00-00 (control mode selection) in the inverter in V1.20 version or the above.

READ: Copy inverter parameters to the keypad

| Steps | Keypad (English) | Description |
| :---: | :---: | :---: |
| 1 |  | Select the copy function group (16) from the group menu. |
| 2 | PARA <br> -07: Copy Sel <br> -8 <br> - READ Sel <br> $-09:$ Keypad Loss Sel | Press the Read / Enter key and select parameter (16-07) copy sel. |
| 3 |  | Press the Read / Enter key to display the data setting / read screen (LCD display is inversed). |
| 4 |  | Change the set value to 1 (read) by using the up arrow key. |
| 5 | $-A D V-$  <br> $\substack{\text { READ } \\ \text { INV } \rightarrow \text { OP }}$  <br>   | - Use Read / Enter key to enable the read operation, the display is shown as the left. <br> - The bottom of LCD display will show a bar to indicate the read progress. |
|  | -ADVREAD COMPLETE | "READ COMPLETE" will be displayed on the keypad when reading was successful. |
| 6 | $$ | - The error message of "RDP Read Prohibited" may occur on the keypad when reading parameters from the inverter is prohibited. <br> - If the error is displayed, press any key to remove the error message and go back to parameter 16-07. |
| 7 |  | When DSP/FUN key is pressed, the display returns to parameter 16-07. |

- WRITE: Copy Keypad parameters to the Inverter

| Steps | LCD Display (English) | Description |
| :---: | :---: | :---: |
| 1 | Group <br> 14 PLC Setting <br> 15 PLC Monitor <br> 16 LCD Keypad Func. | Select the copy function group (16) from the group menu. |

| $16-12$ | RTC Time Setting |
| Range | $【 00: 00 \sim 23: 59 】$ |

Set the internal clock before using the function of Real Time Clock（RTC）．
RTC date setting is determined by parameter 16－11 and RTC time setting is determined by parameter 16－12．
RTC is displayed in the top of the keypad and refer to Fig．4．4．85 for the selection of RTC time display（16－10）is set to 1 ．

| Monitor$00: 00$ <br> Freq Ref <br> $12-16=000.00 ~ H z$ |
| :---: | :---: |
| $12-17=000.00 \mathrm{~Hz}$ |
| $12-18=0000.0 \mathrm{~A}$ |

Figure 4．4．85 RTC Time Display（Example）

## Notes：

－RTC is not enabled if keypad does not connect with the inverter．
－The counting time continues running regardless of the function being hide or display in the paramerer 16－10（RTC Time Display Setting）．

Users can apply the parameters 12－72 and 12－73 to monitor the specific RTC date and time．
RTC has the following characteristics：
－Four times a day
－Four weeks
－Timer offset function（preset time）
－Timrer enables via multi－function digital input
－Selection for contant time and speed
－Timer enables multi－function digital output

Source of timer can be selected to link multiple time periods and one time period can be set to multiple timers．

Timer is set by the following steps：
（1）Start the timer：
Timer starts via the setting of RTC timer function（16－13）．

## （2）Set the time period：

Set the start \＆stop time and date．If the setting of start time is equal to that of stop time，timing period is off．
（3）The timer is enabled：
Arrange time period to the specific timer（16－32～16－35）．

## （4）Link to parameters：

The timer can be linked to the relay output．One relay output can be only linked to one timer（ ex．03－11，03－12 and 03－39，16－36）．

Note：If the stop time is set to 12：00，Motor start to stop from 12：01．

Refer to Fig．4．4．86 for RTC structure．

Figure 4．4．86 RTC structure
Refer to the following Table 4．4．13 for the selection of timer operation cycle．

Table 4.4.13 Arrange time period to the timer function

| $\begin{gathered} 16-32 \\ \underset{16-35}{ } \\ \hline \end{gathered}$ | 0 | P4 | P3 | P2 | P1 | Timer Function | Display |

Reference frequency and motor rotation direction are controlled by RTC function.
16-36=0: RTC speed selection is disabled.
16-36=1: Timer 1 is enabled.
Reference frequency $=$ Frequency Setting of Speed-Stage 0 (05-01)
16-36=2: Timer 2 is enabled.
Reference frequency $=$ Frequency Setting of Speed-Stage 0 (05-01)
$16-36=3$ : Timer 3 is enabled.
Reference frequency $=$ Frequency Setting of Speed-Stage 0 (05-01)
16-36=4: Timer 4 is enabled.

16-36=4: Timer 1 and 2 are enabled.
Reference frequency is enabled by the simultaneous operation of timer 1 and 2.

## Notes:

- The inverter runs via the start of the specific timer without the influence of other timers.
- The selection of RTC speed setting (16-36) is affected by the action of time period 1 to 4 (P1~P4) which is corresponding to the selection of RTC rotation direction (16-37).
For example:
When the selection of RTC speed is set to 5 (by timer $1+2$ ), source of run command ( $00-02$ ) and source of frequecny command ( $00-05$ ) are required to set to RTC. Thus, reference frequency is controlled by RTC timer 1 and 2 and the inverter continues running.

Refer to Table 4.4.14 for the control of reference frequency.
Note: Selection of RTC Rotation Direction (16-37) is limited by the Motor Direction Lock Selection(11-00).

Table 4.4.14 Reference frequency is determined by timer 1 and 2

| Timer 1 | Timer 2 | Main Frequency Command <br> Source Selection (00-05) | Source of frequency setting | Selection of rotation <br> direction |
| :---: | :---: | :---: | :--- | :---: |
| 0 | 0 | $6($ RTC ) | Set by frequency setting of <br> speed-stage 0 (05-01) | By RTC 1 (16-37) |
| 1 | 0 | $6($ RTC) | Set by frequency setting of <br> speed-stage 1 (05-02) | By RTC 2 (16-37) |
| 0 | 1 | $6($ RTC) | Set by frequency setting of <br> speed-stage 2 (05-03) | By RTC 3 (16-37) |
| 1 | 1 | $6($ RTC) | Set by frequency setting of <br> speed-stage 3 (05-04) | By RTC 4 (16-37) |

RTC function can not run normally when:

- When multi-function terminal (03-00~03-05) is set to the fire mode.
- When KEB function is enabled
- Source of main frequency of RTC function is according to Table 4.4.14 and also can refer to main and alternative frequency command modes (00-07).
- If main run command source selection (00-02) is set to $0 \sim 3$ ( 0 : keypad, 1: external terminal, 2: communication control, 3: PLC), refer to Table 4.4.15 for the relationship between main run command and RTC timer status.

Table 4.4.15 Relationship between main run command and RTC timer status

| Main run command <br> $\mathbf{0 0 - 0 2}$ | RTC timer $\mathbf{x}$ status | Inverter status |
| :---: | :---: | :--- |
| $0 \sim 3$ | 0 | Inverter can not run (without run command) |
| $0 \sim 3$ | 1 | Inverter can not run (without run command) |
| 4 | 0 | Inverter can not run (RTC timer is disabled) |
| 4 | 1 | Inverter runs and rotates depending on the function of <br> $16-37$. |

Take an example for RTC timer connecting with different parameters:
The work time on Monday is 6:00 AM to 10:00 PM.
The work time on Tuesday to Friday is 8:00 AM to 8:00 PM.
The work time on Saturday is 8:00 AM to 6:00 PM.

The work time on Sunday is 8:00 AM to 12:00 PM.
Motor runs on weekdays (Mon. to Fri.) at speed 1 and on weekends at speed 2.

Figure 4.4.87 RTC timer (example)
(1) Start up the timer in the parameter group 16 (Set the internal time first to enable this function).

Set the correct date and time in the parameters 16-11 and 16-12 and set parameter 16-13 to 1(enable RTC timer function).

## (2) Set time period 1 (P1)

Start time 1: 16-14 = 06:00:00 (6:00 AM)
Stop time 1: 16-15 = 22:00:00 (10:00 PM)
Start date 1: 16-16 = 1 (Monday)
Stop date 1: 16-17 = 1 (Monday)
(3) Set time period 2 (P2)

Start time 2: 16-18 = 08:00:00 (8:00 AM)
Stop time 2: 16-19 = 20:00:00 (8:00 PM)
Start date 2: 16-20 = 2 (Tuesday)
Stop date 2: 16-21 = 5 (Friday)
(4) Set time period 3 (P3)

Start time 3: 16-22 = 08:00:00 (8:00 AM)
Stop time 3: 16-23 = 18:00:00 (6:00 PM)
Start date 3: 16-24 = 6 (Saturday)
Stop date 3: 16-25 = 6 (Saturday)
(5) Set time period 4 (P4)

Start time 4: 16-26 = 08:00:00 (8:00 AM)
Stop time 4: 16-27 = 12:00:00 (12:00 AM)
Start date 4: 16-28 = 7 (Sunday)
Stop date 4: 16-29 = 7 (Sunday)
(6) Timer 1 is enabled to set all the time periods (P1, P2, P3, P4)
$16-32=15$ : Source of timer $1=P 1+P 2+P 3+P 4)$

## Selection of RTC speed is determined by timer 1

$16-36=1$ : Timer 1 is enabled.
Frequency setting is speed-stage 0 (05-01).
Rotation direction (16-37) is set to 0000b.
Then, the rotation direction of time period $1 \sim 4(\mathrm{P} 1 \sim \mathrm{P} 4)$ is corresponding to the setting of 16-37.
(8) Choose two constant speeds (speed $1 \&$ speed 2)
$16-36=5$ : Timer $1+2$ is enabled.
When timer 1 is enabled, frequency setting is speed-stage 1 ; while timer 2 is enabled, frequency setting is speed-stage 2.
Rotation direction (16-37) is set to 0000b.
Then, when timer 1 and timer 2 are active, direction of motor rotation is forward rotation.

Note: Select RTC offset (16-30) and set RTC offset time (16-31) to enable the offset time. Inverter runs depending on the arranging time period to timer function. Refer to the following Fig.4.4.88.

Figure 4.4.88 Operation of offset time

For example:

## Inverter runs at the time period exclusive P1:

When $16-36=1$ (selection of RTC speed is set to timer 1 ) and $16-32=17$ (offset + PI), RTC offset ( $16-30$ ) is set by DI and the offset time is set via 16-31. Switch on DI and RTC will immediately start up.

If the source of timer is set to 15 (P1+P2+P3+P4), press "STOP" key at the time period 1 (P1). Normally, RTC will start automatically at the next time period (P2) but it can also start via the setting of 16-30 to 2 (set by DI). Inverter re-runs when switching on DI and RTC will immediately start up.

## Notes:

If press "STOP" key at the time period and inverter can re-run at this time, user can:

- $\quad$ Set the selection of RTC offset (16-30) to 2 (set by DI) and set DI to 56 (RTC Offset Enable).
- Switch the selection of RTC offset $(16-30)$ to be enabled.

Note:
RTC Accuracy:

| Temperature | Deviation |
| :---: | :---: |
| $+25^{\circ} \mathrm{C}\left(77^{\circ} \mathrm{F}\right)$ | $+/-3$ sec. $/$ day |
| $-20 /+50^{\circ} \mathrm{C}\left(-4 / 122^{\circ} \mathrm{F}\right)$ | $+/-6$ sec. $/$ day |

## 17-Automatic Tuning Parameters

## Notes:

- Values are for 200 V class, double the values for 400 V class.
- In HD mode ( $00-27=0$ ) the range is 0.0 to $400.0 \mathrm{~Hz}, 0.0$ to 120.0 Hz in for ND mode ( $00-27=1$ ) and 0.0 to 599.0 Hz is high frequency mode.

## Auto-tuning

Based on the motor nameplate set the motor rated output power (17-01), motor output rated current (17-02), motor rated voltage (17-03), motor rated frequency (17-04), motor rated speed (17-05) and number of motor poles (17-06) to perform an auto-tune.

- Automatic tuning mode selection (17-00)

Rotational auto-tuning ( $17-00=0$ ) provide higher quality for motors.
After executing Rotational auto-tuning (17-00), Excitation current of motor 1 (02-09), Core saturation coefficient 1 of motor 1(02-10), Core saturation coefficient 2 of motor 1 and Core saturation coefficient 3 of motor 1 (02-12) will renew the value.

Static auto-tuning ( $17-00=1$ ) won't rotate the motor while auto-tuning.
After executing Static auto-tuning (17-00=1), Proportion of motor leakage inductance (02-33) and Motor slip (02-34) will renew the value.

Stator resistance measurement (17-00=2) provide for long motor leads
After executing Stator resistance measurement (17-00=2), Resistance between wires of motor 1(02-15) will renew the value.

Loop tuning (17-00=4) provide great response of current circuit, it can improve frequency bandwidth of current and torque.
Rotation Auto-tuning Combination (17-00=5) is the auto-tuning for three in one, including Loop tuning ( $17-00=4$ ), Stator resistance measurement $(17-00=2)$ and Rotational auto-tuning ( $17-00=0$ ).

Static Auto-tune Combination (17-00=6) is the auto-tuning for three in one, including Loop tuning ( $17-00=4$ ), Stator resistance measurement (17-00=2) and Static auto-tuning (17-00=1)

- Motor rated output power (17-01)

Set by inverter capacity (13-00)

- Motor rated current (17-02)

Set by inverter capacity (13-00)
Set the range to $10 \% \sim 120 \%$ of the inverter rated current.

- Motor rated voltage (17-03)
- Motor rated frequency (17-04)
- Motor rated speed (17-05)

When tuning a special motor (e.g. constant power motor, high-speed spindle motor), with a motor rated voltage or rated motor frequency that is lower than a standard AC motor, it is necessary to confirm the motor nameplate information or the motor test report.

Prevent the inverter output voltage from saturation when the motor rated voltage is higher than the inverter input voltage (see Example 1).

Example 1: Motor rated voltage $(440 \mathrm{~V} / 60 \mathrm{~Hz})$ is higher than the inverter input voltage $(380 \mathrm{~V} / 50 \mathrm{~Hz})$.

Figure 4.4.99 Rated voltage and frequency settings

Step 1: Set auto-tuning (17-00), and set motor rated output power (17-01) and the motor rated current (17-02) by label of the motor.
Step 2: Set the value of motor rated voltage (17-03) $=440 \mathrm{~V}$ by label of the motor.
Step 3: Set the value of motor rated frequency (17-04) $=60 \mathrm{~Hz}$
Step 4: Set the value of motor rated speed (17-05) , pole number of motor (17-06) and PG pulse number (17-07). Beware that PG pulse number (17-07) only used in SV and V/F+PG mode.
Step 5: Set the value of motor no-load voltage $(17-08)=360 \mathrm{~V}$, the set value for torque control is 20 V lower than input voltage.
Step6: Execute auto-tuning. Set auto-tuning (17-10=1) and enter to standby screen. Enter RUN command to start auto-tuning. The value of selection of PG rotation direction (20-28) adjusts automatically with PG card when auto-tuning. The value of motor rated frequency (17-04) adjusts automatically to the same as the value of base frequency of motor 1 .If the value of maximum output frequency of motor $1(01-02)$ is different form base frequency of motor 1 (01-12), the system will adjusts the value of maximum output frequency of motor $1(01-02)$ the same as base frequency of motor 1 (01-12) automatically.

When the inverter input voltage (or frequency) is higher than the motor rated voltage (or frequency), set the motor rated voltage (17-03) and the motor rated frequency (17-04) to the rated frequency on the motor nameplate.

Example 2: The inverter input voltage and frequency ( $460 \mathrm{~V} / 50 \mathrm{~Hz}$ ) are higher than the motor rated voltage and frequency $(380 \mathrm{~V} / 33 \mathrm{~Hz}$ ), set $17-03$ to 380 V (rated motor voltage) and $17-04$ to 33 Hz (motor rated frequency).

- Number of poles (17-06)

Set the motor pole number with its range is $2,4,6$ and 8 poles

- Number of PG pulse (17-07)

Set the pulse number of each cycle. If the control mode is SV mode and the $V / F+P G$ mode, the encoder must be installed on the motor shaft and there is no reduction gear ratio.

- Motor no-load voltage (17-08)
a) Motor no-load voltage is mainly used in SV or SLV mode, set to value $10 \sim 50 \mathrm{~V}$ lower than the input voltage to ensure good torque performance at the motor rated frequency.
b) Set to $85 \sim 95 \%$ of the motor rated voltage. In general, the no-load voltage can be closer to the motor rated voltage for larger motors, but cannot exceed the motor rated voltage.
c) The motor no-load voltage can be set to a value greater than the actual input voltage. In this case, the motor can only operates under relatively low frequency. If the motor operates at the rated frequency an over voltage condition may occur.
d) The higher the motor power is, the higher the no-load voltage is.
e) A smaller no-load voltage will reduce the no-load current.
f) When load is applied the magnetic flux is weakened and the motor current increases.
g) A higher no-load voltage results in a higher the no-load current.
h) When load is applied the magnetic flux weakens and the motor current increases. Increasing the magnetic flux generates back EMF and results in poor torque control.
- Motor excitation current (17-09)
a) Motor excitation current is used for rotational auto-tune.
b) Set motor excitation current to $33 \%$ of the motor rated current. Refer to parameter 02-09 for test running.
c) Only the static-type or stator resistance measurement auto-tune ( $17-00=1$ or $1700=2$ ) can be set.
d) It is required to refer to the monitoring parameter 12-76 for adjusting the motor excitation current (17-09). When the excitation current change, parameter 12-76 is also affected so it should be adjusted to the setting no-load voltage (17-08).
- Automatic tuning start (17-10)

Set parameter 17-10 to 1 and press ENTER the inverter will display "Atrdy" for Auto-tune ready. Next press RUN to start the auto-tune procedure. During auto-tune the keypad will display "Atune "for Auto-tune in progress. When the motor is successfully tuned, the keypad shows "AtEnd".

- Error history of automatic tuning (17-11)

If auto-tuning fails the keypad will display the AtErr" message and the auto-tune cause is shown in parameter 17-11. Refer to section 5 for troubleshooting and possible automatic tuning error causes.

Note: The motor tuning error history (17-11) shows the tuning result of the last auto-tune. No error is displayed when auto-tune is aborted or when the last auto-tune was successful.

Perform the "Stator resistance measurement" (17-00=2) auto-tune if the inverter/motor leads are longer than $167 \mathrm{ft}(50 \mathrm{~m})$.

For the best performance in vector control perform the rotary-type automatic tune (17-00 $=0$ ) first (using short motor leads between the inverter and motor) and a "Stator resistance measurement" (17-00=2) next.

If a rotary auto-tune ( $17-00=0$ ) cannot be performed, manually enter the mutual induction ( $02-18$ ), excitation current (02-09), core saturation compensation factor 1-3 (02-11-02-13).

Perform the "Stator resistance measurement" (17-00=2) in V/F control when inverter/motor leads are longer than 167 ft ( 50 m ).

| $17-12$ | Proportion of Motor Leakage Inductance |
| :---: | :--- |
| Range | $0.1 \sim 15.0 \%$ |

Only the stator resistance auto tune $(17-00=2)$ can be set．

The static non－rotational type and rotational type auto tune will automatically measure the proportion of motor leakage inductance so this parameter is not active．

It is set the value to $4 \%$ ．Refer to parameter 02－33 for test run to adjust．

| $17-13$ | Motor Slip Frequency |
| :---: | :--- |
| Range | $0.10 \sim 20.00 \mathrm{~Hz}$ |

Only the stator resistance auto tune（17－00＝2）can be set．

The static non－rotational type and rotational type auto tune will automatically measure the proportion of motor leakage inductance so this parameter is not active．

Refer to parameter 02－34 for counting the setting value．

| $17-14$ | Rotational Auto－tuning |
| :---: | :--- |
| Range | 【0】：VF type rotational auto－tuning |
|  | 【1】：Vector type rotational auto－tuning |

It can be set（17－14）only if Rotational auto－tuning（17－00＝0）or Rotational Auto－tuning Combination（17－00＝5）． VF type rotational auto－tuning $(17-14=0)$ applies the standard IM motor that won＇t shake without loading for V／F mode．This function is highly applicable，

Vector type rotational auto－tuning（17－14＝1）applies the special IM motor that will shake without loading for V／F mode．This function applies for high speed motor．Vector type rotational auto－tuning（17－14＝1）measures no－loading current of motor by inner current vector method．It avoid the problem appears oscillating current easily in V／F mode．

If execute VF type rotational auto－tuning（17－14＝0）unsuccessfully，try Vector type rotational auto－tuning （17－14＝1）again．

## 18-Slip Compensation Parameters

| $18-00$ | Slip compensation gain at low speed |
| :---: | :--- |
| Range | $0.00 \sim 2.50$ |

| 18-01 | Slip compensation gain at high speed |
| :---: | :--- |
| Range | $-1.00 \sim 1.00$ |

| 18-02 | Slip compensation limit |
| :---: | :--- |
| Range | $0 \sim 250 \%$ |

| 18-03 | Slip compensation filter |
| :---: | :--- |
| Range | $0.0 \sim 10.0 \mathrm{Sec}$ |

| 18-04 | Regenerating slip compensation selection |
| :---: | :--- |
| Range | 0: Disable <br> $1:$ Enable |

| 18-05 | FOC delay time |
| :---: | :--- |
| Range | $1 \sim 1000 \mathrm{msec}$ |

| 18-06 | FOC gain |
| :---: | :--- |
| Range | $0.00 \sim 2.00$ |

Slip compensation automatically adjusts the output frequency based on the motor load to improve the speed accuracy of the motor mainly in V/F mode.

The slip compensation function compensates for the motor slip to match the actual motor speed to the reference frequency.

## Slip compensation adjustment in V/F mode

## 18-00: Slip compensation gain at low speed

The adjustment of slip compensation gain at low speed follows the below procedure:

1. Set the rated slip and the motor no-load current (02-00).
2. Set the slip compensation (18-00) to 1.0 (factory default setting is 0.0 in V / F control mode)
3. For the operation with a load attached, measure the speed and adjust the slip gain (18-00) accordingly (increase in steps of 0.1).

- If the motor speed is lower than frequency reference, increase the value of 18-00.
- If the motor speed is higher than frequency reference, decrease the value of 18-00.

When the output current is greater than the no-load current (02-00), the slip compensation is enabled and the output frequency increases from f1 to f2. Refer to Figure 4.4.100., the slip compensation value is calculated as follows:

[^1]Motor Rated Slip Frequency $(\mathrm{f})=\frac{(\text { Motor no-load synchronous speed }- \text { Motor full load rated speed })(\mathrm{N}) \times \text { Motor Poles }(\mathrm{P})}{120}$

Figure 4.4.100 Slip compensation output frequency
18-02: Slip compensation limit
Sets slip compensation limit in constant torque and the constant power operation (figure 4.4.101).
If $18-02$ is $0 \%$, the slip compensation limit is disabled.

Figure 4.4.101 Slip compensation limit
When the slip compensation gain 18-00 at low speed is adjusted, and the actual motor speed is still lower than the reference frequency, the motor may be limited by the slip compensation limit.

Note: Make sure that the slip compensation limit 18-02 does not exceed the maximum allowed system limit.
18-03: Slip compensation filter
Set slip compensation filter time in V/F mode
18-04: Regenerating slip compensation selection
The selections to enable or disable the slip compensation function during regeneration.
To enable slip compensation during regeneration caused by deceleration (SLV mode), set 18-04 to 1 in case speed accuracy is required. When the slip compensation function is used regenerative energy might increase temporarily $(18-04=1)$ therefore a braking module might be required.

## SLV mode adjustment

18-00: Slip compensation gain
a) Slip compensation can be used to control the full rang speed accuracy under load condition.
b) If the speed is lower than 2 Hz and the motor speed decreases, increase the value of 18-00.
c) If the speed is lower than 2 Hz and the motor speed increases, reduce the value of $18-00$.

Slip compensation gain uses a single value for the whole speed range. As a result the slip compensation accuracy at low speed is high but slight inaccuracies might occur at high speeds.

Adjust parameter 18-02 together with the compensation value or continue to adjust 18-00 if the speed accuracy at higher speed is not acceptable. Please note adjusting these parameters might impact the accuracy at lower speeds.

The impact of 18-00 on the torque and the speed are shown in figure 4.4.102.

Figure 4.4.102 18-00 Effect on the torque and speed
18-01: Slip compensation gain at high speed
It is not required to adjust the Slip compensation gain at high speed if the motor is loaded. After adjusting parameter 18-00 it is recommended to increase the reference frequency and check the motor speed. In case of a speed error increase the value of 18-01 to adjust the compensation. Increase the motor rated frequency (01-12 base frequency) and increase the value of $18-01$ to reduce the speed error. If the speed accuracy becomes worse due to an increase in motor temperature it is recommended to use a combination of 18-00 and 18-01 for adjustment.

Compared to 18-00, 18-01 serves as a variable gain for the full speed range. Parameter 18-01 determines the slip compensation at the motor rated speed and is calculated follows:

Slip Compensation Gain $=($ Slip Compensation Gain at low speed + Slip Compensation Gain at high speed $) \times \frac{\text { Reference Frequency }}{\text { Motor rated frequency (01-12) }}$

Figure 4.4.103 18-00/18-01 Slip compensation gain versus frequency reference

Figure 4.4.104 18-01 Effect on torque speed curve
18-05: FOC (Flux Orient Control) delay time
In the SLV mode, the slip compensation of the magnetic flux depends on the torque current and excitation current. If the motor load rises above $100 \%$ while running at the motor rated frequency, the motor voltage and resistance drops sharply, which may cause the inverter output to saturate and current jitter occur. The magnetic flux slip compensation will independently control the torque current and the excitation current to prevent current jitter. For slow speed or fixed speed operation, 18-05 may be increased. For fast operation adjust 18-06.

18-06: Slip compensation gain
If the motor is jittering at the rated frequency under full load, the value of 18-06 may gradually be reduced to zero to reduce current jitter.

## SLV2 mode adjustment

Default value of parameter $18-00$ is 0.0 . ( when $18-00=0.0$, slip compensation function is off.)
Adjustment of slip compensation gain (18-00) is the following:
a) Correctly set the rated slip and no-load current (02-00).
b) Set slip compensation gain (18-00).
c) Run under load. Measure the speed and adjust slip compensation gain (18-00) with the unit of 0.1.

## Notes:

- If the motor speed is lower than the target speed, increase the setting value of low-speed slip compensation gain (18-00).
- If the motor speed is higher than the target speed, reduce the setting value of low-speed slip compensation gain (18-00).

| $\mathbf{1 9 - 0 0}$ | Center frequency of wobble frequency |
| :---: | :--- |
| Range | $5.00 \sim 100.00 \%$ |

| 19-01 | Amplitude of wobble frequency |
| :---: | :--- |
| Range | $0.1 \sim 20.0 \%$ |

| $19-03$ | Jump time of wobble frequency |
| :---: | :--- |
| Range | $0 \sim 50 \mathrm{msec}$ |

| $19-04$ | Wobble frequency cycle time |
| :---: | :--- |
| Range | $0.0 \sim 1000.0 \mathrm{Sec}$ |

| 19-05 | Wobble frequency ratio |
| :---: | :--- |
| Range | $0.1 \sim 10.0 \mathrm{msec}$ |

| 19-06 | Upper offset amplitude of wobble frequency |
| :--- | :--- |
| Range | $0.0 \sim 20.0 \%$ |

| $19-07$ | Lower offset amplitude of wobble frequency |
| :---: | :--- |
| Range | $0.0 \sim 20.0 \%$ |

Wobble operation can be used in V/F and V/F+PG control mode to modulate the output frequency around the reference frequency for use in winding application to create an evenly wound roll.

Refer to the figure 4.4.105 for the wobble operation and the related parameter settings.

Figure 4.4.105 Wobble operation and the related parameter setting
In wobble operation, one of multifunction digital inputs (03-00 to 03-07) is set to 37 (wobble operation) and the run command is active. When the wobble operation is ready, the inverter output frequency reaches the center frequency (19-00). The acceleration time to the center frequency is the original pre-set acceleration time (Tacc 1 to Tacc 4). When the wobble operation is closed or the run command is removed, the deceleration time used is the original pre-set deceleration time (Tdec 1 to Tdec4).

In wobble operation, the inverter operates uses the in the wobble time (19-04, tup + tdown) and wobble frequency
(19-05, tup / tdown).
Set multi-function digital output terminals (R1A-R1C, R2A-R2C) to output wobble operation (in acceleration) by setting from 03-11 to $03-12$ to 20 or 21 .

Refer to the figure 4.4.106 for the wobble ON / OFF control.

Figure 4.4.106 ON/OFF control of wobble

In wobble operation, the center frequency can be controlled by one of multi-function digital inputs.
The wobble upper and lower deviation command ( $03-00$ to $07=38$ ) and the wobble lower deviation command ( $03-00$ to $07=39$ ) cannot be active at the same time, this will result in the inverter operating at the original center frequency (19-00). Refer to Figure 4.4.107.

Figure 4.4.107 Upper/Lower offset operation

The wobble operation can be used during acceleration and deceleration when the stall prevention function is idle.
Select the appropriate inverter size to match the system requirement.
The wobble operation frequency range is determined by the upper limit and lower limit of the inverter frequency. If (center frequency + amplitude) is greater than the upper frequency limit, the output frequency is limited to the upper frequency limit; if (center frequency - Amplitude) is less than the lower frequency limit the output frequency is limited to the lower frequency limit.

| 20-00 | ASR gain 1 |
| :---: | :--- |
| Range | $0.00 \sim 250.00$ |

| 20-01 | ASR integral time 1 |

Parameter $20-33$ is used when $20-07$ is set to 0 and frequency command source is set to analog input mode. Analog input signal, owing to the noise, will cause the system to determine the operation does not reach the constant speed so the problem may occur. Thus, adjust parameter 20-33 to avoid this situation occurring..

The following figure an overview of the automatic speed regulator (ASR) block.

## V/F + PG control mode:

The ASR function adjusts the output frequency to control the motor speed to minimize the difference between the frequency reference and actual motor speed.

Figure 4.4.108 ASR block diagram (V/F + PG)

If one of the multi-function input (03-00 to 03-07) is set to 42 ( PG is disabled), the input can be used to enable or disable the speed control loop system (ASR).

## SLV control mode:

The ASR function adjusts the output frequency to control the motor speed to minimize the difference between the frequency reference and actual motor speed.

The ASR controller in SLV mode uses a speed estimator to estimate the motor speed. In order to reduce speed feedback signal interference, a low-pass filter and speed feedback compensator can be enabled.

The ASR integrator output can be disabled or limited. The ASR output is passed through a low-pass filter.

Figure 4.4.109 ASR block diagram (SLV mode)

## SV control mode and PMSV mode:

The ASR function adjusts the output frequency to control the motor speed to minimize the difference between the frequency reference and actual motor speed.

The ASR controller in SLV mode uses a speed estimator to estimate the motor speed. In order to reduce speed feedback signal interference, a low-pass filter and speed feedback compensator can be enabled.

The ASR integrator output can be disabled or limited. The ASR output is passed through a low-pass filter.

Figure 4.4.110 Speed control block diagram (SV \& PMSV mode)

## ASR setting in V/F +PG control mode

In V/F+PG mode, set the proportional (P) gain and integral (I) time at the minimum output frequency (20-02 and $20-03$ ) and maximum output frequency (20-00 and 20-01). Refer to the figure 4.4.111.

Figure 4.4.111 ASR gain setting (V/F+PG)

## Tuning the speed control ASR gain:

a) ASR gain tuning at minimum output frequency

1. Operate the motor at the lowest output frequency.
2. Increase the ASR proportional gain $2(20-02)$ as much as possible without causing instability.
3. Decrease the ASR integral time 2(20-03) as much as possible without causing instability.
4. Check that the output current is less than $50 \%$ of the inverter rated current.

If the output current is more than $50 \%$ of the inverter rated current, decrease 20-02 and increase 20-03.
b) ASR gain tuning at maximum output frequency

1. Operate the motor at the highest output frequency (Fmax).
2. Increase the ASR proportional gain $1(20-00)$ as much as possible without causing instability.
3. Decrease the ASR integral time 1(20-01) as much as possible without causing instability.
c) The gain tuning of acceleration / deceleration integral control (20-07)
4. To enable during acceleration / deceleration operation set $20-07=1$ (enabled), the integral control is enabled.
5. Integral control enables the motor speed to reach its target speed as soon as possible, but it may result in over or undershoot, as shown in Figure 4.4.114 \& 4.4.115.
6. When one of multi-function digital inputs ( $03-00$ to $03-07$ ) is set to 43 (speed control integral reset), the input can be used to switch between P control and PI control of the speed control loop system (ASR). When the multi-function digital input is on, only P control is active and the integral is reset.
a. If the speed overshoot occurs, reduce 20-00 system (ASR proportional gain) and increase the 20-01 system (ASR integral time 1).
b. If the desired speed is not reached, reduce 20-02 system (ASR proportional gain 2 ) and increase 20-03 (ASR integral time 2).
c. If you cannot eliminate the speed over or undershoot using the gain tuning described above, decrease the ASR + / - limit (20-05 / 20-06), to decrease the reference frequency compensation ( $\Delta \mathrm{f}$ ) limit. Since 20-05/20-06 cannot be changed during running, it is necessary to stop the inverter first and then decrease the ASR + / - limit.
7. See figure 4.4.112, observe the motor speed waveform and tune the gain at the same time.

Figure 4.4.112 Analog output setting
d) $\mathrm{ASR}+/$-limit $(20-05,20-06)$

ASR +/-limit is ASR frequency compensation limit and is set as a percentage of the maximum frequency output 01-02.
Note: If the frequency limit is set too low, the actual motor speed may not reach the target speed.

## ASR setting (SV/SLV/PMSV control mode)

In SLV mode the ASR gain is divided into a high-speed and low-speed section. The speed controller has a high-speed gain 20-00/20-01 and a low-speed gain 20-02/20-03 that can be set independently.
a) The high/low switch frequency can be set with parameter 20-15 and 20-16. Similar to the ASR gain, the speed estimator has a high-speed gain 20-09/20-10 and a low-speed gain 20-11/20-12.
b) The speed estimator has a low-pass filter to reduce the speed feedback interference, parameter 20-13 and 20-14 are active at high speed as well as low speed. The switch between the high-speed and the low-speed is set by parameter 20-15 and 20-16.
c) 20-17 sets the low-speed compensation gain of the speed feedback.
d) 20-18 sets the high-speed compensation gain of the speed feedback.
e) When the frequency reference is rises above the value set in 20-16, the ASR gain used is set by parameters 20-00 and 20-01.
f) When the frequency reference falls below the value set in 20-15, the ASR gain used is set by parameters 20-02 and 20-03.
g) Gain time constant is adjusted linearly when the speed command falls within the range of $20-15$ to $20-16$, for a smooth operation.

Figure 4.4.113 ASR gain setting (SLV mode)

## SV and PMSV gain setting

In SV and PMSV mode the ASR gain is divided into a high-speed and low-speed section. The speed controller has a high-speed gain 20-00/20-01 and a low-speed gain 20-02/20-03 that can be set independently.

## Tune the speed control gain

During ASR gain tuning, the multi-function analog output (AO1 and AO2 terminal) can be used to monitor the output frequency and motor speed (as shown in figure 4.4.113). Use parameters 20-00 ~ 20-03 for full speed range gain tuning in SV and PMSV mode.
a) Complete the parameter tuning in normal operation.
b) Increase ASR proportional gain 1 (20-00), ASR proportional gain 2 (20-02), carefully monitor system stability.
Use parameter 20-00 and 20-02 to adjust the speed response for each cycle. Tuning the settings of 20-00, 20-02 can increase system response, but may cause system instability. See figure 4.4.114.

Figure 4.4.114 System response of ASR proportion gain
a) Reduce ASR integral time 1(20-01), ASR integral time 2 (20-02) and carefully monitor system stability.

1. A long integral time will result in poor system response.
2. If the integral time setting is too short, the system may become unstable Refer to the following figure.

While tuning ASR P and I gain the system may overshoot and an over voltage condition can occur. A braking unit (braking resistor) can be used to avoid an over voltage condition.

Figure 4.4.115 The response of ASR integral time

SLV mode gain tuning (20-00~20-03, 20-09~20-18) and SLV2 mode gain tuning (20-15, 20-16)
Tune the low-speed ASR P and I gain 20-02 ~ 20-03, make sure the reference frequency is below the value of parameter 20-15. P gain and integral time tuning is the same as for parameter 20-00 and 20-01 in SV mode.

Tune the high-speed ASR PI gain 20-00~20-01, make sure the reference frequency is above parameter 20-16 value. P gain and integral time tuning is the same as for parameter 20-00 and 20-01 under SV mode.

Both low-speed ASR gain and the high-speed gain can be set to the same values and only require to be adjusted in case of system instability.

In case tuning of the ASR $P$ and I gain 20-00~20-03 does not improve the system response, reduce the low-pass filter time constant 20-13~20-14 to increase the bandwidth of the feedback system and re-tune the ASR gain.

Tune low-speed low-pass filter time constant 20-14, make sure the reference frequency is below parameter 20-15 value

- Tune high-speed low-pass filter time constant 20-13 at frequency reference, make sure the reference frequency is above parameter 20-16 value.
- Increasing the low-pass filter time constant can limit the bandwidth of the speed feedback system and may
reduce the system response. Increasing the low-pass time reduces the speed feedback signal interference but may results in sluggish system response when the load suddenly changes. Adjust the low-pass filter time if the load stays fairly constant during normal operation. The low bandwidth of the speed feedback must be supported by the low gain of ASR to ensure the stable operation.
- Decreasing the low-pass filter time constant may increase the bandwidth of the speed feedback and the system response. Decreasing the low-pass time may increase the speed feedback interference resulting in system instability when the load suddenly changes. Decrease the low-pass filter time is a quick system response is required for rapidly changing loads. The high bandwidth of the speed feedback allows for a relative high ASR gain.
- In case tuning 20-00 ~ 20-03 and the low-pass filter time constant 20-13 do not improve the system response time, tuning the PI gain 20-09 ~ 20-12 of the speed estimator may be required.
- Setting a high gain for the speed estimator (high proportion ( P ) gain and small integral (I) time) increases the bandwidth of the speed feedback, but may cause speed feedback interference resulting in system instability.
- Setting a low gain for the speed estimator (small proportion ( P ) gain and high integral (I) time) decreases the bandwidth of the speed feedback, may improve speed feedback interference resulting in a more stable system.
- The default values for the ASR can be used in most applications, no adjustment is required. Adjusting the low-pass filter time and speed estimator gains requires a good understanding of the overall system. If a high-speed system response in combination with stable operation is required consider using SLV or SV control mode.
- Parameter 20-15 sets the gain switch frequency at low-speed and parameter 20-16 sets the gain switch frequency at high-speed.
- Operating at a speed below 20-15 will result in a larger excitation current for low-speed operation accuracy. When the frequency reference rises above 20-16, the inverter will output the rated excitation current at the no-load voltage (02-19).
- For general purpose applications parameter 20-15 should be set to a value of 5 ~ $50 \%$ of the motor base frequency.
- If this value is too high, the inverter output may saturate. Parameter $20-16$ should be set to a value of 4 Hz or more above the value of 20-08.
- When experiencing speed jitter at high speed and stable operation during mid-range speed while operating a heavy load ( $>100 \%$ ), it is recommended to reduce the no-load voltage ( $02-19$ ) or tune the FOC parameters (18-05 ~ 18-06).
- Parameter 20-17 and 20-18 are for compensating speed feedback at low speed and high speed.

■ Use parameter 20-17 to adjust the torque compensation gain for the low speed range. By tuning 20-17an offset is added to the torque-speed curve. Increase 20-17 when the no-load speed is lower than the frequency reference. Decrease 20-17 when the no-load speed is higher than the frequency reference. The effect on the torque-speed curve from 20-17 is shown as the following figure:

Figure 4.4.116 Effect on the torque-speed curve from 20-17
■ Use parameter 20-18 to adjust the torque compensation gain for middle to high speed range. For most general purpose applications it is not necessary to adjust the 20-18. By tuning 20-18an offset is added to the torque-speed curve. Increase 20-18 when the no-load speed is lower than the frequency reference. Decrease 20-18 when the no-load speed is higher than the frequency reference. The effect on the torque-speed curve from 20-18 is shown as the following figure 4.4.117.

Figure 4.4.117 Effect on the torque-speed curve from 20-17
(1). ASR main delay time (20-08).
a) Does not required to be adjusted for general purpose applications
b) When the set value of 20-08 is set high, the speed response will and therefore system response will decrease improving system stability.
(2). ASR integral limit (20-04)
a) Setting a small value may prevent system response when the load suddenly changes.

| Range | 1~1000 |

- PG card is required (JN5-PG-O/JN5-PG-L/JN5-PG-PM) PG pulse divider ratio can be set parameter 20-29.
- PG feedback setting
(1) Over speed operation setting (20-19 to 20-21)
a) When the motor speed exceeds the tuning limit, an error is detected.

If the motor speed feedback exceeds the value of 20-20 (overspeed detection level) for the time specified in 20-12 (over speed detection delay time) an over-speed (OS) condition is detected.
b) Overspeed detection selection (20-19) specifies the stop method for the inverter in case of an overspeed condition.
(2) PG Speed deviation setting (20-22 to 20-24)
a) When the speed deviation (difference between the set speed and the actual motor speed) exceeds the tuning limit, an error is detected.
b) If the speed deviation is greater than the value of 20-23 (deviation detection level) for the time specified in 20-24 (deviation detection delay time), a speed deviation (DEV) is detected.
c) Speed deviation is based on the reference frequency $\pm$ speed deviation width, parameter 20-23.
d) Speed deviation detection selection (20-22) specifies the stop method for the inverter in case of a speed deviation condition.
(3) PG detection setting (20-25 to 20-26)
a) When the inverter no longer received pulses fro, the PG feedback for the time specified in 20-26 a PG open condition is detected.
b) PG open detection selection (20-25) specifies the stop method for the inverter in case of a PG open condition.

Refer to figure 4.4.118 for the PG fault detection block diagram.

Figure 4.4.118 Logic diagram PG feedback failure detection
(4) Set PG pulse (20-27)
a) Set PG of pulse number of the encoder for phase $A$ or phase $B$ for each cycle
b) If a gearbox is used between the motor and PG the gear ratio can be set with parameter 20-30 and 20-31.
(5) PG rotation direction (20-28)

Parameter is used to set the motor direction and PG direction. Make sure phase $A$ or phase $B$ is leading for motor forward direction operation.

20-28=0: Forward operation, phase $A$ is leading (phase $B$ is leading for reversal operation).
$\mathbf{2 0 - 2 8 = 1}$ : Forward operation, phase $B$ is leading (phase $A$ is leading for reversal operation).

Figure 4.4.119 PG and motor rotation direction
Motor direction is determined as below:
Forward: The motor direction is counter-clockwise when inverter runs in forward direction (see figure 4.4.120.)

Figure 4.4.120 Motor operation direction

Forward: The motor direction is clockwise when inverter runs in forward direction (see figure 4.4.121.) Refer to the below figure 4.4.121 for PG feedback pulses.

Figure 4.4.121 PG operation direction
(6) PG pulse dividing ratio (20-29)

Sets the pulse divider ratio between the PG input and PG output.
The left most digit $\left(3^{\text {rd }}\right)$ represent the numerator and the last to represent the denominator.
Ratio is calculated as follows:
$20-29=\underline{\underline{\square}}$ 므, $=\underline{n} \mathrm{kk}$
Range n: 0 to 1
Range k: 1 to 32
Ratio $=(1+n) / k$

## Examples：

20－29＝001 $\rightarrow \mathrm{n}=0, \mathrm{k}=1$ ，proportion $=(1+0) / 1=1$
20－29 $=032 \rightarrow \mathrm{n}=0, \mathrm{k}=32$ ，proportion $=(1+0) / 32=1 / 32$
20－29 $=132 \rightarrow \mathrm{n}=1, \mathrm{k}=32$ ，proportion $=(1+1) / 32=1 / 16$
（7）Gear ratio of PG and motor（20－30，20－31）．
Gear ratio specifies when a gearbox is connected between the PG and the motor
a）Set the gear ratio of the load side parameter 20－31．
b）Set the gear ratio of the motor side parameter 20－30．
Motor speed is calculated as follows：

$$
\text { Motor Speed }(\text { RPM })=\frac{\text { No. of input pulses from PG } \times 60}{\text { PG pulses }(20-27)} \times \frac{\text { No. of PG gear teeth } 2(20-31)}{\text { No. of PG gear teeth } 1(20-30)}
$$

Note：The response speed in $V / F+P G$ mode is less than that of $S V$ mode．

| $20-32$ | Special encoder selection |
| :---: | :--- |
| Range | $0:$ None <br> $1:$ Resolver |

Select encoder type．Power to the inverter needs to be cycled for changes to take effect．
Note：Resolver card doesn＇t support position mode．

| 20－34 | Compensation Gain of Derating |
| :---: | :--- |
| Range | $0 \sim 25600$ |

This gain effect is the same as ASR proportional gain（20－00，20－02）．And if this parameter is coupled with low－pass filter time constant（20－35），it can avoid oscillation．

It is suggested that the setting value of parameter 20－34 is $30 \sim 50$ ．

| $\mathbf{2 0 - 3 5}$ | Compensation Time of Derating |
| :---: | :--- |
| Range | $0 \sim 30000 \mathrm{mSec}$ |

This time constant is used for suppressing the oscillation produced by 20－34．But too large compensation time constant will cause slower output response and then is unfavorable for turned compensation．

It is suggested that the setting value of parameter $20-35$ is $50 \sim 100 \mathrm{~ms}$ ．

Refer to Fig．4．4．108 and Fig．4．4．109．Torque compensation function of derating can reduce the characteristics of ASR turning around under shock load．

| $20-43$ | MPG speed magnification calculation |
| :--- | :--- |
| Range | $【 1 \sim 500 】$ |
| $20-44$ | MPG speed command limit |
| Range | $【 0.1 \sim 30.0 】 \mathrm{~Hz}$ |

In manual pulse generator（MPG）mode，the speed calculated by the MPG Input is multiplied by the parameter （20－43）speed multiplier，and is limited by the parameter（20－44）speed command，to perform speed command upper limit．

## 21-Torque And Position Control Parameters

| $\mathbf{2 1 - 0 0}$ | Torque control selection |
| :---: | :--- |

| 21-03 | Speed limit value |
| :--- | :--- |
| Range | $-120 \sim 120 \%$ |

| 21-04 | Speed limit bias |
| :--- | :--- |
| Range | $0 \sim 120 \%$ |

21-00: Torque control selection
Select between speed control and torque control in SV mode.
21-00=0: Speed control (20-00, 20-09), ASR setting
21-00=1: Torque control (21-01 to 4), torque control setting
A multi-function digital input terminal (03-00 to 03-08) set to 44 (speed / torque control switching) can be used to switch between speed and torque mode externally. When the input terminal is active torque control is selected otherwise speed control is selected.

Refer to figure 4.4.109 for the speed control architecture and figure 4.4.122 for torque control architecture.

Figure 4.4.122 Block figure of the torque control

The torque reference command (Tref) uses analog input AI2 (04-05=15)
Note: Torque reference command cannot be set via the keypad.

Multi-function analog input (AI2) can used for torque reference ( $04-05=15$ ) (torque) or torque compensation level (04-05=16).

The direction (torque output) of the motor depends on the polarity of the analog input signal (AI2) instead of the direction of the run command.

Analog input AI2: Positive voltage forward torque reference (Motor direction counter clockwise).
Analog input AI2: Negative voltage reverse torque reference (Motor direction clockwise).

To switch to a negative torque reference set one of the multi-function digital input (03-00 to 03-07) to 45 (negative torque command), and activate the digital input terminal (Motor direction clockwise).

Table 4.4.37 Torque input method

| Input | Input terminal | Parameter setting | Description |
| :---: | :---: | :---: | :---: |
| Voltage input (0-10V) | $\begin{gathered} \text { Al2 } \\ \text { Selection "V" } \end{gathered}$ | 04-00=0,2 | Terminal Al2 signal level: 0 - 10V |
|  |  | 04-05=15 | Al2 used as for torque reference |
| Current input$(4-20 \mathrm{~mA})$ | Al2 <br> Selection "l" | $04-00=1,3$ | Terminal Al2 signal level: 4-20mA |
|  |  | 04-05=15 | Al2 used as for torque reference |

21-01: Torque filter time
Time constant used to reduce the torque signal interference and adjust the torque response. Increase filter time in case the system becomes unstable.

21-02/21-03: Speed limit input setting

Limits the motor speed while operating in torque control. When the external torque reference and the system load are out of balance the speed limit may be used to prevent the motor from damaging the system.

The speed limit can be set via the digital inputs or using and analog input signal to set the speed limit level. Refer to the table 4.4.17 for the speed limit input method.

Table 4.4.38 Speed limit input method

|  | Input method | Input terminal | Related parameter setting | Description |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $\begin{array}{\|l} \text { Voltage input } \\ (-10 \mathrm{~V}-10 \mathrm{~V}) \end{array}$ | Al1 | 21-02=0 | Analog input (Al1 or Al2) as speed limit |

|  |  |  | 04-00=0,2 | Terminal Al2 signal level : 0V-10V |
|  |  |  | 04-05=12 | Al2 will be added to terminal Al1 as speed limit value |
|  | $\begin{aligned} & \text { Current input } \\ & (4-20 \mathrm{~mA}) \end{aligned}$ | AI2 (Selection =" I") | 21-02=0 | Analog input (Al1 or Al 2 ) as speed limit |
|  |  |  | 00-05=1 | Analog input (Al1 or Al2 is set by 04-05) as reference frequency input |
|  |  |  | 04-00=1,3 | Terminal Al2 signal level : 4-20mA |
|  |  |  | 04-05=12 | Al2will be added to terminal Al1 as speed limit value |
| 2 | Parameter 21-03 setting | - | 21-02=1 | Set the speed limit to be controlled by 21-03 |
|  |  |  | 21-03 | Set speed limit |
| 3 | Communication Input (2502H) | S+ \& S- | 21-02=2 | Communication is used to be the speed limit. |

The rotation direction in speed control depends on the speed limit signal:

- Positive voltage: Forward, speed limit (21-03+21-04).
- Reverse speed limit is zero or reversal direction (-21-04).
- Negative voltage: Reverse, speed limit (-21-03-21-04).
- Forward, speed limit is zero or forward direction (21-04).

If the speed limit bias is set to 0 , the motor speed will be limited to 0 when the rotation direction of the motor and the speed limit are in reverse.

Example: The speed limit analog signal is a positive voltage and the motor is in forward operation, then the effective speed range in torque control is from 0 to the analog speed limit value.

## 21-04: Speed limit bias setting

Speed limit bias (21-04) is used to adjust the boundaries of the speed limit. The speed limit bias (21-04) can be used to set the same limit value in forward and reversal direction and is set as a percentage of the maximum output frequency (01-02).

Example 1: Set 30\% speed limit in forward and reverse direction.

Figure 4.4.123 Speed limit setting

## Example 2:

Settings: 1. Speed limit value (21-03) $=100 \%$ (positive speed limit)
2. Speed limit bias $(21-04)=20 \%$

The speed range in torque control is from $-20 \%(21-04)$ to $120 \%(21-03+21-04)$

-When the speed exceeds the reverse speed limit(- 20\%), the torque is increased in the positive direction and is limited by the regenerative torque limit in the 2nd quadrant.

Figure 4.4.124 Speed limit setting (Example 2)

Example: Torque limit and speed limit operation:
In this example the torque limit and speed limit are used in a winding and unwind operation.

## Winding operation

The line speed $(\mathrm{N})$ and motor torque $(\mathrm{T})$ are in the same direction of the motor. Refer to Figure 4.4.125

Figure 4.4.125 Winding operation
(1). Speed limit bias $(-21-04)>$ Motor Speed $>$ speed limit bias $(+21-04) \rightarrow$ torque based on Tref.
(2). Motor speed $(\mathrm{N})>$ speed limit bias $+21-04 \rightarrow$ speed limit will output negative torque to prevent the increase of motor speed.
(3). Motor speed $(\mathrm{N})<-21-04 \rightarrow$ speed limit will output a forward torque to prevent an increase of speed.

## Unwinding operation

The line speed ( N ) and motor torque $(\mathrm{T})$ are in opposite direction output torque

Figure 4.4.126 Unwind operation

The relationship among Tref (torque reference), NLmt (speed limit) and $N$ (motor speed) is shown below when used in winding operation and roll-out operation.

| Operations | Winding operation |  | Unwind operation |  |
| :---: | :---: | :---: | :---: | :---: |
| T-N curve |  |  |  |  |
| Operation direction | Forward | Reverse | Forward | Reverse |
| Tref ( Torque reference) | + | - | - | + |
| $\begin{gathered} N_{\text {Lmt }} \\ \text { (Speed limit) } \end{gathered}$ | + | , | + | - |
| Architecture |  |  |  |  |

Figure 4.4.127 Winding and roll-out operations

## Torque compensation

Torque compensation is used to compensate for torque loss due to mechanical damage or other losses. Multi-function analog input Al2 can used for torque compensation ( $04-05=16,04-07 / 08$ Gain/ Bias).

Set the appropriate signal level for the torque compensation. The torque compensation direction is based on the analog signal polarity, not by the direction of the run command.

When Tcomp is fixed at a positive voltage (or current) results in a positive torque compensation (the rotation of motor shaft is counterclockwise).

| 21-05 | Positive torque limit |
| :---: | :--- |
| Range | $0 \sim 300 \%$ |

| 21-06 | Negative torque limit |
| :--- | :--- |
| Range | $0 \sim 300 \%$ |

| 21-07 | Forward regenerating torque limit |
| :---: | :--- |
| Range | $0 \sim 300 \%$ |

| 21-08 | Reversal regenerating torque limit |
| :---: | :--- |
| Range | $0 \sim 300 \%$ |

Use the torque limit function to limit the torque applied to the load, or limit the regenerative torque.
In speed control the torque limit function has a higher priority than the motor speed control and compensation. This might result in extended acceleration, deceleration times and a reduction in motor speed.

Torque limit can be set in two ways:

- Use torque limit parameters (21-05 to 21-08) to set a fixed torque limit.
- Set the torque limit by using the multi-function analog input (Al2).

There are four torque limits that can be set separately, one for each quadrant:
(I) Positive torque limit in forward direction (21-05 positive torque limit)
(II) Positive torque limit of reverse direction (21-06 negative torque limit)
(III) Negative torque limit in reverse direction (21-07 forward regenerating torque limit)
(IV) Negative torque limit in forward direction (21-08 reversal regenerating torque limit)

Refer to Figure 4.4.128.

Figure 4.4.128 Torque limit setting

Torque limit setting by using multi-function analog input AI2 (04-05)
Table 4.4.39 Torque limit analog input

| $\mathbf{0 4 - 0 5}$ (AI2) | Function |
| :---: | :--- |
| 11 | Positive torque limit |
| 12 | Negative torque limit |
| 13 | Regenerative torque limit (for both forward and reversal directions). |
| 14 | Positive/negative torque limit (positive and negative detection torque limit ) |

Set the analog input terminal (Al2) signal level (04-00), gain (04-07) and bias (04-08)
The default setting for the analog input AI2 is $0-10 \mathrm{~V}$ representing $0-100 \%$ of the motor rated torque).
Figure 4.4.129 shows the relationship between the output torque and the torque limit.

Figure 4.4.129 Analog input torque limit (A12)
When the analog input is set to positive torque limit (value $=11$ ) the torque limit is active in the third and fourth quadrant.in the reverse direction (regenerative torque in the second quadrant).

When the analog input is set to negative torque limit (value $=12$ ) the torque limit is active in the third and fourth quadrant.

When the analog input is set to regenerative torque limit (value $=13$ ) the torque limit is active in the second and fourth quadrant can be controlled.

When the analog input is set to positive/negative torque limit (value $=14$ ) the torque limit is active in all four quadrants.

When the analog input is at maximum ( 10 V or 20 mA ), the torque limit is $100 \%$ of the motor rated torque. In order to increase the torque limit above $100 \%$ the analog input gain (04-07) has to set to a value greater than $100 \%$. For example: 200.0\% of the gain will result in the torque limit of $200 \%$ of motor rated torque at 10 V (20mA) analog input level.

## 21-09 Maximum frequency for position control

Maximum output frequency when moving to the next position. The position control function uses acceleration time 1 (00-14).

Maximum output frequency when moving to the next position. The position control function uses deceleration time 1 (00-15).

In the SV control mode, multi-function digital input terminals (03-00 to 03-07) can be used to select the position. See table 4.4.40.

Figure 4.3.130 Zero-servo positioning

Table 4.4.40 Multi-position positioning function setting

| Digital Input setting <br> 03-00~03-07 | Function |
| :---: | :--- |
| 02 | Multi-speed/position setting command 1 |
| 03 | Multi-speed/position setting command 2 |
| 04 | Multi-speed/position setting command 3 |
| 05 | Multi-speed/position setting command 4 |
| 46 | Zero-Servo command |
| 51 | Select between speed control and position control |
| 52 | Position command enable |

## Zero-servo positioning function (Zero-Servo):

When the output frequency falls below Fmin and the zero-servo input is active, the position is locked in and the inverter enters zero-servo positioning mode (Zero-Servo). Positioning command PosRef is origin, as shown in figure 4.4.130.

Refer to parameter 11-49 and 11-50 for zero-servo gain and zero-servo count and parameter 20-02 and 20-03 to setup the speed regulator function.

## Multi-position function (MultiPosRef):

Parameter $21-42$ is set to 0 and the speed is lower than the lowest frequency so the inverter will enter into the position mode. If input multi-speed and multi-position command switch ( DI is set to 51 ) in the zero-servo mode,
multi-speed command 1~4 is transformed to multi-position command $1 \sim 4$ and the origin of zero-servo mode has 17-section position. Refer to Fig.4.4.131.
Spindle Positioning Function (Z-phase locked function)
Parameter 21-42 is set to 1 and the speed is lower than the lowest frequency so the inverter will enter into the position mode when Z-phase signal appears. The origin is positioned in z phase signal and the setting value of parameter 21-43. It can be also coupled with multi-position function.
Z phase bias value of monitoring parameter 12-78 will display the bias between $Z$ phase and the current position.
User can rotate the motor at one cycle depending on the rotation direction. Z phase bias value of parameter 12-78 is the differential value between steering position $Z$ point after capturing the position of $Z$ point. Make the value of 12-78 input the offset angle of parameter 21-43 after the position is confirmed. Then the origin is positioned at $Z$ phase signal + the setting value of parameter 21-43.

Note: If the motor is just at power on and does not pass the $Z$ point, parameter 12-78 will display 9999.

## Position control:

- Activate Run command (RUN)
- Activate Zero-Servo command (Zero-Srvo)
- Activate Position enable command (MultiPosEn)
- $\quad$ Select a position with the multi-function digital inputs (PosRef)

Refer to figure 4.4.131.

Figure 4.4.131 Multi-positioning logic diagram
Refer to parameter 20-28 to set PG motor direction.

A position is defined by the number of rotations plus the number of pulses.
When multi-position function is used, position command enable (Multi Pos. Enable, DI is set to 52) is required to be ON so the inverter can receive the external position command. Refer to Fig. 4.4.132.

Fig. 4.4.132 Position Enable Diagram
Multi-position mode is the absolute type. If the first section is at 100 pulse and make the motor rotate at more than 100 pulse, then the second section is required to set at 200 pulse. Refer to Fig. 4.4.133.

Figure 4.4.133 the absolute type diagram
Position setting (21-10~21-41) :

Motor Position Setting of $N$ section $=$ Rotation Cycles Command of $N$ section xPG Pulse (20-27) + Pulse Command of $N$ section

## Example: 2 Positions

Motor encoder is 1024 PPR.
Position 1: Rotate motor shaft in forward direction 180 degrees, set rotation cycle to 0 and pulse number to 512 ( $1 / 2 \times 1024$ ). Positive number indicated forward direction.

Position 2：Rotate motor shaft 1reverse 270 degrees（ -768 pulses），set rotation cycle to 0 and pulse number to $-768(-3 / 4 \times 1024)$ ．Negative number indicated forward direction．

## 22－PM Motor Parameters

| 22－00 | PM motor rated power |
| :---: | :---: |
| Range | $0.00 \sim 600.00 \mathrm{Kw}$ |
|  |  |
| 22－01 | PM motor rated voltage |
| Range | $\begin{aligned} & \text { 230V: 【50~240】V } \\ & \text { 460V:【100~480】V } \end{aligned}$ |

| 22－02 | PM motor rated current |
| :---: | :--- |
| Range | $25 \% \sim 200 \%$ inverter＇s rated current |

| 22－03 | PM motor＇s pole number |
| :---: | :--- |
| Range | $2 \sim 96$ Poles |

| 22－04 | PM Motor＇s rated rotation speed |
| :--- | :--- |
| Range | $6 \sim 60000 \mathrm{rpm}$ |

| 22－05 | PM motor＇s maximum rotation speed |
| :---: | :--- |
| Range | $6 \sim 60000 \mathrm{rpm}$ |

| 22－06 | PM motor rated frequency |
| :--- | :--- |
| Range | $4.8 \sim 599.0 \mathrm{~Hz}$ |

| 22－07 | PM type selection |
| :--- | :--- |
| Range | 【0】 SPM <br> 【1】IPM |

The PM parameter group can be restored to factory default be initializing the inverter（13－00）．
1．PM motor rated power（22－00）；PM motor rated voltage（22－01）；PM motor rated current（22－02） Setting the motor nameplate value．
2．PM motor pole number（22－03）；PM motor rated rotation speed（22－04）；PM motor rated frequency（22－06） Setting the motor nameplate value．For the PM motor rated rotation speed（22－04）and the PM motor rated frequency（22－06），just set one of the two and the program will automatically calculate the other．When setting the PM motor rated rotation speed（22－04），the PM motor＇s maximum rotation speed（22－05）will synchronize and update to the same setting．When using the flux－weakening function，the PM motor＇s maximum rotation speed（22－05）setting value must be revised．The formula is as follows：

$$
(\mathrm{PM} \text { 馬達額定轉速 }) \mathrm{N}=\frac{120 \times f(\mathrm{PM} \text { 馬達額定頻率) }}{\mathrm{P} \quad \text { (PM馬達極數) }}
$$

3．PM motor＇s maximum rotation speed（22－05）
When using the flux－weakening function，the PM motor＇s maximum rotation speed（22－05）must be set higher than the PM motor＇s rated rotation speed（22－04）．

4．PM type selection（22－07）
When using the SPM motor，the recommended setting is 0 ．Related adjustable parameters are the speed estimated gain（22－30）and the speed estimated filter value（22－31）．
When using the IPM motor，the recommended setting is 1 ．Related adjustable parameters are the speed estimated gain（22－34）and the speed estimated filter value（22－35）．

| 22－08 | PM Encoder Type |

| 22－26 | Estimator Mode |
| Range | 0～1（in PMSLV mode） |
| 22－27 | Voltage Command of Mode 2 |
| Range | 【5～120】 \％（22－25＝2 or 22－26＝1 is enabled） |
| 22－28 | Divider Ratio of Mode 2 |
| Range | 【0～8】（22－25＝2 or 22－26＝1 is enabled） |
| 22－29 | Flux－weakening Voltage Command Restriction |
| Range | 【80～110】 \％（related to parameter 22－18） |

## 22－08：PM Encoder Type

After PM encoder type is adjusted，the inverter is required to reconnect to renew the system．
If user does not need the specified encoder types，select mode 3 to avoid error occurring．When mode 3 is selected，start mode is the strong magnetic and the current is about $100 \%$ setting value of the rated current （22－02）at start．Magnetic pole search is according to parameter 22－25 or start upon the angle before stopping．

If $22-25=0$ ，inverter at the first start after power failure drives the motor in 0 degree since the angle of motor last stop does not exist and vibration my occur at start－up．

Sine wave card is for Heidenhain ERN 1387，ECN 1313 and ECN413

## Note：

1．Sine wave card doesn＇t support position mode．
2．If PG card and PM encoder is not matched，SE07 fault will occur．
3．If PM encoder type（22－08）is reset，it is required to reconnect and then perform PM motor tuning（22－21）． Find the offset angle of the magnetic pole again．If the above actions are not performed，SE08 fault will occur．

## 22－10：PM SLV Start Current

Set torque current at start and the unit is the percentage of motor rated current．

## 22－11：I／F Mode Start Frequency Switching Point

This function is for the switching point from open－loop to close－loop in PMSLV mode．The unit is percentage for rated speed of motor ．It recommends that over $5 \%$ for 400 V and over $10 \%$ for 200 V ．

## 22－14：Armature Resistance of PM Motor

Set resistor for each phase of the motor in unit of $0.001 \Omega$ ．It is set automatically when the motor auto－tunes （22－21）．

Note: Do not be confused with line-to-line resistance.

## 22-15: D-axis Inductance of PM Motor

Set motor's D-axis inductance in unit of 0.001 mH . It is set automatically when the motor auto-tunes (22-21).

## 22-16: Q-axis Inductance of PM Motor

Set motor's $Q$-axis Inductance in unit of 0.001 mH . It is set automatically when the motor auto-tunes (22-21).

## 22-18: Flux-weakening Current Command Restriction

1. When the MTPA's selected (22-32) setting is 0 , the setting parameter's (22-05) maximum motor rotation speed is higher than the parameter's (22-04) motor rated rotation speed. This will automatically activate the flux-weakening control. Set this parameter to restrict the maximum flux-weakening capability. The unit is the motor's rated current percentage.
2. When the MTPA's (22-32) selected setting is 2 or 3 , and the output voltage is too high, the flux-weakening voltage command restriction setting value must be raised.

## 22-20: Offset Angle of the Magnetic Pole and PG Origin

Magnetic pole alignment offset value is stored in this parameter after tuning.

## 22-21: PM Motor Tuning

## WARNING!

Sudden start: The inverter and motor may start unexpectedly during Auto-Tuning, which could result in death or serious injury. Make sure the area surrounding of the motor and load are clear before proceeding with Auto-Tuning.

## WARNING! Electric Shock Hazard

High voltage is supplied to the motor when performing an auto-tune, even when the motor is stopped, which could result in death or serious injury. Do not touch the motor when performing magnetic pole realignment until the auto-tuning procedure is completed.

## WARNING! Holding Brake

Do not perform a magnetic pole realignment auto-tuning procedure when the motor is connected to a brake this may result in incorrect motor data calculation.

Disconnect the motor and the load and confirm that the motor can freely run.

1. Before selecting PM motor tuning, enter the motor data (22-00) - (22-06) according to the motor nameplate and the number of encoder pulses (20-27).
2. 

a) Use parameter 22-21 to select tuning mode. If $00-00=4$ (PMSV), please set $22-21=2$ to tuning. If $00-00=5$ (PMSLV), please set 22-21=1 to tuning.
b) When $00-00$ set to 4 (PMSV), if the motor pole number (22-03) is unknown, please set 22-21=2. If PM encoder type (22-08) set to 4 (Sine wave, ECN1313, ECN413 and ERN1387) or specific encoder (20-32)
set to 1 (Resolver) and the motor pole number (22-03) is known, please set 22-21=1 (Parameter auto-tune), then set to 3 (Magnetic pole alignment), the tuning time can be reduced.
Note 1: If encoder type (22-08) set to $0 \sim 3$, and set $22-21=3$, PM Tune Error03 will be display. Note 2: If 22-21 set to 2 or 3 to motor tuning, and PM Tune Error04 happens, PG rotation direction (20-28) will be change automatically, please do motor tuning again by same items. If the same error happen again, please re-wire the feedback or motor phase sequence, then do motor tuning again.
c) Next press the enter key to go to the PM motor tuning screen. The keypad will display the message of "IPrdy" (Ready to Tune).
d) Press run to start the PM motor tuning. The keypad will display the "IPtun" message during auto-tune.
e) If the motor is successfully tuned, the message of "IPEnd " will be displayed. If auto-tune is aborted with the stop key, the operator will display the message of " IPbrd "(PM motor tuning aborted).

## Notes:

1. Perform a magnetic pole alignment auto-tune before adjusting the speed loop.
2. It is not required to perform a magnetic pole alignment auto-tune each time the inverter is powered up.

## 22-22: Fault History of PM Motor Tuning

If PM motor tuning has failed, the "IPErr" message is shown on the keypad (PM motor tuning failure). Refer to section 10 for the possible error causes and trouble shooting.

PM motor tuning fault history (22-22) only stores the result of the last auto-tune performed .If auto-tuning was successful or aborted, no error will be displayed.

## 22-25: Detection Mode Selection of Initial Magnetic Pole

Select the motor activation's rotor position detection method
Method 0: Do not detect rotor position, start by directly using the angle when the motor was previously stopped
Method 1: Use input pulse signal to detect rotor position.
Method 2: Use input continuous variable frequency signal to detect rotor position.

## 22-26: Estimator Mode

- It is suggested to set $22-26=0$ when SPM motor is used. Inverter starts in $1 / f$ mode and the relevant adjustable parameters are 22-10 \& 22-11.
- It is suggested to set $22-26=1$ when IPM motor is used and speed control mode is performed by the speed control ratio 1:50. Inverter will input the continuously variable frequency signal to motor and the relevant adjustable parameters are 22-27 \& 22-28.

## 22-27: Voltage Command of Mode 2

When $22-25=2$ or setting of parameter $22-26$ is enabled, input of the voltage amplitude setting for the continuously variable frequency signal will influence the motor jittering. When the motor starts and the rotor jitter occurs, it is required to increase the voltage amplitude to ensure the accuracy of detection angle.

Note: When the voltage value is set too high, overcurrent error may occur.

## 22-28: Divider Ratio of Mode 2

When $22-25=2$ or setting of parameter $22-26$ is enabled, the input of continuous signal frequency depends on the parameter (11-01) carrier setting. If the carrier setting is higher, it is required to appropriately increase the divider ratio so as to reduce the input of continuous signal frequency and ensure the accuracy of detection angle.

## 22－29：Flux－weakening Voltage Command Restriction

It is set for preventing the saturation of the output voltage．Inverter performs flux－weakening control by the percentage of input power supply voltage as the limit of output voltage command．If flux－weakening current command restriction（22－18）is set too low，inverter output voltage may exceed the voltage command limit．

| 22－30 | SPM Speed Estimation Gain |
| :---: | :---: |
| Range | 【1～100】 \％ |
| 22－31 | SPM Speed Estimation Filter Value |
| Range | 【1～2000】 Hz |
| 22－32 | MTPA Selection |
| Range | 【0】 ：Disabled <br> 【1】：Mode 1 <br> 【2】：Mode 2 <br> 【3】：Mode 3 |
| 22－33 | MTPA Gain |
| Range | 【0～400】 \％ |
| 22－34 | IPM Estimator Gain |
| Range | 【0．1～ 500.0 】 |
| 22－35 | IPM Estimator Compensation |
| Range | 【0～300】 \％ |

## 22－30：Speed Estimated Gain <br> 22－31：Speed Estimated Filter Value

In adjusting the speed response performance，the higher the setting value，the faster the motor reacts，however，if the setting value is too high，the control object will generate vibrations and become unstable，also，if the setting value is lower，the speed deviation will increase．Please adjust to the appropriate setting value according to the field equipment．

## 22－32：MTPA Selection

0：MTPA invalid
1：Distribute $\mathrm{D}-\mathrm{Q}$－axis current command according to the torque command．
2：Distribute D－Q－axis current command according to the torque command and restrict output voltage（12－19）to below the motor＇s rated voltage（22－01）．
3：Distribute D－Q－axis current command according to the torque command and control the output voltage（12－19） to around the motor＇s rated voltage（22－01）．

## 22－33：MTPA Gain

When the default value is $200 \%$ ，revising the PM motor＇s D－axis inductance（22－15）or Q－axis inductance（22－16） （such as completing the PM motor adjustment or directly changing the inductance value）will re－calculate the MTPA Gain（22－33）．

## 22：34：IPM Estimator Gain

When the estimator mode（22－26）setting is 1 ，the estimator gain is the multiple of the bandwidth．The larger the setting value，the faster the motor response．However，if the value is too high，the control item will exhibit vibration and become unstable．The smaller the setting value，the greater the speed deviation．Please adjust the appropriate setting value according to the site equipment．

## 22-35: IPM Estimator Compensation

When the estimator mode (22-26) setting is 1 , adjust the estimator compensation will change the output voltage. Adjustments can be made according to the following situation:
When the output voltage (12-19) is too low (Note 1), the compensation setting value must be set higher.
When the MTPA function (22-32) is at 1 , and the output voltage is still too high (Note 2), adjust to a lower compensation setting value.
When the MTPA function (22-32) is at 2, and the output voltage is still too high, then increase the flux-weakening restrict $(22-18)$ parameter setting value.
Note 1: When the permanent magnet motor is operating at no load frequency conditions, the output voltage should be greater than or equal to the motor back EMF coefficient stated on the nameplate.
Note 2: When the permanent magnet motor is operating at full load frequency conditions, the output voltage should be lesser than or equal to the motor's rated voltage stated on the nameplate.

## Chapter 5 Check Motor Rotation and Direction

This test is to be performed solely from the inverter keypad. Apply power to the inverter after all the electrical connections have been made and protective covers have been re-attached.

Important: Motor rotation and direction only applies to standard AC motors with a base frequency of 60 Hz . For 50 Hz or other frequency AC motors please set the max frequency and base frequency in group 01 accordingly before running the motors.

## - LED Keypad Display

At this point, DO NOT RUN THE MOTOR, the LED keypad should display as shown below in Fig. 5.1 and all LEDs are flashing. Next press the RUN key, all LEDs light on. See Fig 5.2. The motor should now be operating at low speed running in forward (clockwise) direction. The value shown in the screen will change from 000.00 Hz to 005.00 Hz . Next press STOP key to stop the motor.

Fig 5.1: LED Keypad (Stopped)

Fig 5.2: LED Keypad (Running)

## - LCD Keypad Display

At this point, DO NOT RUN THE MOTOR, the LCD keypad should display as shown below in Fig. 5.3 and the speed reference $12-16=005.00 \mathrm{~Hz}$ should be blinking at the parameter code " $12-16$ ". Next press the RUN key, see Fig 5.4. The motor should now be operating at low speed running in forward (clockwise) direction. The parameter code 12-17 shown at the bottom left corner of the screen will change from $12-17=000.00 \mathrm{~Hz}$ to $12-17=005.00 \mathrm{~Hz}$. Next press STOP key to stop the motor.

Fig 5.3: LCD Keypad (Stopped)

Fig 5.4: LCD Keypad (Running)

## Notes:

- If the motor rotation is incorrect, power down the inverter.
- After the power has been turned OFF, wait at least ten minutes until the charge indicator extinguishes completely before touching any wiring, circuit boards or components.
- Using Safety precaution, and referring to section 3.8 exchange any two of the three output leads to the motor ( $\mathrm{U} / \mathrm{T} 1, \mathrm{~V} / \mathrm{T} 2$ and $\mathrm{W} / \mathrm{T} 3$ ). After the wiring change, repeat this step and recheck motor direction.

## Chapter 6 Speed Reference Command Configuration

The inverter offers users several choices to set the speed reference source. The most commonly used methods are described in the next sections.

Frequency reference command is selected with parameter 00-05.

## 00-05: Main Frequency Command (Frequency Source)

This function sets the frequency command source.

Setting Range: 0 to 5

To set parameter 00-05:

- After power-up press the DSP/FUN key
- Set Group 00 (Basic Fun), and select parameter - 05 with the UP/DOWN $\mathbf{\Delta}$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

| $\mathbf{0 0 - 0 5}$ | Main Frequency Command Source Selection |
| :--- | :--- |
|  | 0: Keypad |
|  | 1: External control (analog) |
|  | 2: Terminal command UP / DOWN |
| Range | 3: Communication control (RS-485) |
|  | 4: Pulse input |
|  | 5: Reserved |
|  | 6: Reserved |
|  | 7: Al2 Auxiliary Frequency |
|  | 8: Manual Pulse Generator (MPG) |

### 6.1 Reference from Keypad

## - LED Keypad:

Use the $<$ RESET, $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys to change the speed reference and then press the READ/ ENTER key. Refer to section 4.1.5 for more details.

## - LCD Keypad:

Press the READ/ ENTER key first and use the </RESET, $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ keys to change the speed reference.

### 6.2 Reference from External Analog Signal (0-10V / 4-20mA)

Analog Reference: 0-10 V (Setting 00-05 = 1)

Analog Reference: Potentiometer / Speed Pot (Setting 00-05 = 1)

Analog Reference: 4-20mA (Setting 00-05 = 1)

### 6.3 Reference from Serial Communication RS485 (00-05=3)

To set the speed reference for the inverter via serial communication parameter 00-05 has be set to " 3 " for frequency command via serial communication.

Default Communication Setting is: Address "1", 9600 Bits/sec, 1 Start Bit, 1 Stop Bit, and No Parity
The serial communication link function uses RS485 Modbus RTU protocol and allows for:

1) Monitoring (data monitoring, function data check).
2) Frequency setting.
3) Operation command (FWD, REV, and other commands for digital input).
4) Write function data.

## Frequency Reference Command Register

Inverter Frequency Reference Register: 2502 (Hexadecimal) - Bit 0 - Bit 15: 0.00 ~ 599.00 Hz

## Examples:

Frequency Reference Command: 10.00 Hz (Inverter Node Address: 01)

Command String (hexadecimal): 0106250203 E8 23 B8

To set the frequency reference to 10.00 , a value of ' 1000 ' (03E8h) has to be send to the inverter.

Frequency Reference Command: $\mathbf{3 0 . 0 0} \mathbf{~ H z ~ ( I n v e r t e r ~ N o d e ~ A d d r e s s : ~ 0 1 ) ~}$

Command String (hexadecimal): 01062502 0B B8 2444
To set the frequency reference to 30.00 , a value of ' 3000 ' (0BB8h) has to be send to the inverter.

Frequency Reference Command: 60.00 Hz (Inverter Node Address: 01)

Command String (hexadecimal): 010625021770 2D 12

To set the frequency reference to 60.00 , a value of ' 6000 ' ( 1770 h ) has to be send to the inverter

Note: The last 2 bytes of the command strings consist of a CRC16 checksum, please refer to section 4.5 of the instruction manual for additional information.

### 6.4 Reference from Pulse Input (00-05=4)

Serial pulse input (Internal resistence : 3.89 K)

## Specification

Low Input Level: 0.0 to 0.5 V
High Input Level: 4.0 to 13.5 V
Duty cycle: (ON / OFF) 30 \% to 70\%
Pulse Input frequency range: 50 to 32 KHz

## Set Pulse Input Setup as Frequency Reference

Set parameter 00-05 to 4 and 03-30 to 0 to use the pulse input terminal Pl as the frequency reference source. Next set the pulse input scaling (03-31), enter the pulse input frequency to match the maximum output frequency. Adjust the pulse input filter time in case interference or noise is encountered.

Example: Pulse train input maximum 10 kHz , set parameter $03-31$ to 10000 when maximum frequency is set to 60.0 Hz .

| 03- 30 | Selection of Pulse Input |
| :--- | :--- |
| Range | $0:$ General Pulse Input <br> $1:$ PWM |

Function selects source for the pulse input.

| $\mathbf{0 3 - 3 1}$ | Scale of pulse input |
| :---: | :--- |
| Range | Depending on the setting of $03-30$ |
|  | $03-30=0: 50 \sim 32000 \mathrm{~Hz}$ |
|  | $03-30=1: 10 \sim 1000 \mathrm{~Hz}$ |

Pulse input scaling, $100 \%=$ Maximum pulse frequency.

| 03- 32 | Pulse input gain |
| :--- | :--- |
| Range | $0.0 \sim 1000.0 \%$ |

Target value (03-03) in \% = Pulse input frequency scaled to $100 \%$ based on maximum pulse frequency (03-31) times the gain (03-32) + bias (03-33).

| 03-33 | Pulse input bias |
| :---: | :--- |
| Range | $-100.0 \sim 100.0 \%$ |

Target value (03-03) in \% = Pulse input frequency scaled to $100 \%$ based on maximum pulse frequency (O3-31) times the gain (03-32) + bias (03-33).

| 03-34 | Pulse input filter time |
| :---: | :--- |
| Range | $0.00 \sim 2.00 \mathrm{Sec}$ |

### 6.5 Reference from two Analog Inputs

Analog input Al1 is used as master frequency reference and analog input AI2 is used as auxiliary frequency reference.

Analog Reference Al1: 0-10 V (Setting 00-05 = 1)
Analog Reference Al2: 0 - 10 V (Setting 00-06 = 1, 04-05 = 1)

| Al1 - Analog Input 1 | Al2 - Analog Input 2 | 04-00 Setting <br> (Default = 1) | Dipswitch SW2 <br> (Default 'V') |
| :--- | :--- | :--- | :--- |
| $0 \sim 10 \mathrm{~V}$ | $0 \sim 10 \mathrm{~V}$ | 0 | Set to 'V' |
| $0 \sim 10 \mathrm{~V}$ | $4 \sim 20 \mathrm{~mA}$ | Set to 'l' |  |

| E |  |  |  | 2 |  |  | S6 |  | S8 |  | 24V |  |  | GND | AI |  | AI2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | DOG |  |  | S3 |  |  | S7 |  | F1 |  |  |  |  |  | AO2 | E |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 6.6 Change Frequency Unit from Hz to rpm

Enter the number of motor poles in 16-03 to change the display units from Hz to rpm.

| 16-03 | Display unit |
| :---: | :---: |
| Range | $\mathbf{0}$ : Frequency display unit is Hz (Resolution is 0.01 Hz ) |
|  | 1: Frequency display unit is \% (Resolution is $0.01 \%$ ) |
|  | 2: Frequency display unit is rpm. |
|  | 3~39: Reserved |
|  | 40~9999: $100 \%$ is XXXX with no decimals (integer only) |
|  | 10001~19999: $100 \%$ is $X X X . X$ with 1 decimal |
|  | 20001~29999: $100 \%$ is $X X . X X$ with 2 decimals |
|  | 30001~39999: $100 \%$ is $\mathrm{X} . \mathrm{XXX}$ with 3 decimals |

## Chapter 7 Operation Method Configuration (Run / Stop)

The inverter offers users several choices to run and stop from different sources. The most commonly used methods are described in the next sections.

Operation command is selected with parameter 00-02.

00-02: Run Command Selection

This function sets the frequency command source.

Setting Range: 0 to 3

To set parameter 00-02:

- After power-up press the DSP/FUN key
- Set Group 00 (Basic Fun), and select parameter -02 with the UP/DOWN $\mathbf{A}$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

| $\mathbf{0 0 - 0 2}$ | Main Run Command Source Selection |
| :--- | :--- |
| Range | 0: Keypad control |
|  | 1: External terminal control |
|  | 2: Communication control (RS-485) |
|  | 3: PLC |

### 7.1 Run/Stop from the LED/LCD Keypad (00-02=0)

Use the RUN key to run the drive in forward direction and the FWD/REV key to change the motor direction. (Note: to disable reverse direction set parameter 11-01 to 1)

Press STOP key to stop the inverter. (Note: Stop method can be set with parameter 07-09, default is deceleration to stop).

### 7.2 Run/Stop from External Switch / Contact or Pushbutton (00-02=1)

Use an external contact or switch to Run and Stop the inverter.

## Example: NPN wiring

- Permanent Switch / Contact

## - Momentary Contacts (Push Buttons)

Use push button / momentary switch to Run and Stop the inverter.

Set parameter 13-08 to 3, 5 or 7 for 3 -wire program initialization, multi-function input terminal S 1 is set to run operation, S2 for stop operation and S7 for forward/reverse command.

00-01 Operation Method $=1$
03-07 Terminal S7 Function = 26

Note: Stop mode selection can be set with parameter 07-09, default is deceleration to stop.

### 7.3 Run/Stop from Serial Communication RS485 (00-02=3)

To control (Run/Stop) the inverter via serial communication parameter 00-02 has be set to either a " 2 " for communication control.

Default Communication Setting is: Address "1", 19200 Bits/sec, 1 Start Bit, 1 Stop Bit, and No Parity
The serial communication link function uses RS485 Modbus RTU protocol and allows for:

1) Monitoring (data monitoring, function data check).
2) Frequency setting.
3) Operation command (FWD, REV, and other commands for digital input).
4) Write function data.

## Command Register

Inverter Command Register: 2501 (Hexadecimal)
Bit 0: Run Forward
Bit 1: Run Reverse
Bit 2 ~ Bit 15: Refer to the chapter XX of this manual

## Examples:

## Run Forward Command (Inverter Node Address: 01)

Command String (hexadecimal): 01062501000112 C6

Run Reverse Command (Inverter Node Address: 01)

Command String (hexadecimal): 0106250100039307

Stop Command (Inverter Node Address: 01)
Command String (hexadecimal): 010625010000 D3 06

Note: The last 2 bytes of the command strings consist of a CRC16 checksum, please refer to section 4.5 of the instruction manual for additional information.

## Chapter 8 Motor and Application Specific Settings

It is essential that before running the motor, the motor nameplate data matches the motor data in the inverter.

### 8.1 Set Motor Nameplate Data (02-01, 02-05)

## 02-05 Rated power of motor 1

The nominal motor rated capacity is set at the factory. Please verify that the motor name plate data matches the motor rated capacity shown in parameter 02-05. The setting should only be changed when driving a motor with a different capacity.

Range: 0.00 to $600.00 \mathrm{~kW}(1 \mathrm{HP}=0.746 \mathrm{~kW})$
To set parameter 02-05:

- After power-up press the DSP/FUN key
- Set Group 02 (Motor Parameter), and select parameter -05 with the UP/DOWN $\triangle$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

Default values vary based on the inverter model.

## 02-01 Rated current of motor 1

The motor rated current is set at the factory based on the inverter model. Enter the motor rated current from the motor nameplate if it does not match the value shown in parameter 02-01.

Setting range: 0.01 to 600.00 A
To set parameter 02-01:

- After power-up press the DSP/FUN key
- Set Group 02 (Motor Parameter), and select parameter -01 with the UP/DOWN $\triangle$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

### 8.2 Acceleration and Deceleration Time (00-14, 00-15)

Acceleration and Deceleration times directly control the system dynamic response. In general, the longer the acceleration and deceleration time, the slower the system response, and the shorter time, the faster the response. An excessive amount of time can result in sluggish system performance while too short of a time may result in system instability.

The default values suggested normally result in good system performance for the majority of general purpose applications. If the values need to be adjusted, caution should be exercised, and the changes should be in small increments to avoid system instability.

## 00-14 Acceleration time 1 <br> 00-15 Deceleration time 1

These parameters set the acceleration and deceleration times of the output frequency from 0 to maximum frequency and from maximum frequency to 0 .

To set parameter 00-14 or 00-15:

- After power-up press the DSP/FUN key
- Set Group 00 (Basic Fun), and select parameter -14 or -15 with the UP/DOWN $\triangle$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

Acceleration and deceleration times are represented by the three most significant (high order) digits. Set acceleration and deceleration times with respect to maximum frequency. The relationship between the set frequency value and acceleration/deceleration times is as follows:

Set Frequency = Maximum Frequency

Set Frequency < Maximum Frequency

Note: If the set acceleration and deceleration times are set too low, the torque limiting function or stall prevention function can become activated if the load torque and or inertia are relatively high. This will prolong the acceleration and or deceleration times and not allow the set times to be followed. In this case the acceleration and or the deceleration times should be adjusted.

### 8.3 Torque Compensation Gain (01-10)

This parameter sets the relationship between output frequency and output voltage. Constant torque applications have the same torque requirements at low speed as well as at high speed.

## Initial Setup

For Variable Torque / Normal Duty applications set parameter 01-10 to an initial value of 0.5.

For Constant Torque / Heavy Duty applications set parameter 01-10 to an initial value of 1.0.

01-10 Torque compensation gain
This parameter sets the torque boost for motor 1.
Setting range: 0.0 to 2.0

To set parameter 01-10:

- After power-up press the DSP/FUN key
- Set Group 01 (V/F Pattern), and select parameter -10 with the UP/DOWN $\triangle$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

Increase value when:

- The wiring between the inverter and the motor very too long
- The motor size is smaller than the inverter size

Note: Gradually increase the torque compensation value and make sure the output current does not exceed inverter rated current.

Reduce value when:

- Experiencing motor vibration
- Over Current Fault
- Overload Fault

Important: Confirm that the output current at low speed does not exceed the rated output current of the inverter.

Warning: A larger than required torque compensation gain value creates over-excitation at low speeds, continued operation may cause the motor to overheat. Check the characteristics of the motor for additional information.

### 8.4 Automatic Energy Saving Functions (11-19)

In the V/F control mode the automatic energy saving (AES) function automatically adjusts the output voltage and reduces the output current of the inverter to optimize energy savings based on the load.

The output power changes proportional to the motor load. Energy savings is minimal when the load exceeds $70 \%$ of the output power and savings become greater when the load decreases.

The parameter of automatic energy saving function has been set at the factory before shipment. In general, it is no need to adjust. If the motor characteristic has significant difference from TECO standard, please refer to the following commands for adjusting parameters:

## Enable Automatic Energy Savings Function

To set parameters 11-19 to 11-24:

- After power-up press the DSP/FUN key
- Set Group 11 (Auxiliary Function Group), and select parameter -19 to -24 with the UP/DOWN $\triangle$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.
(1) To enable automatic energy saving function set 11-19 to 1.
(2) Filter time of automatic energy saving (11-20)
(3) Commissioning parameter of energy saving (11-21 to 11-22)

In AES mode, the optimum voltage value is calculated based on the load power requirement but is also affected by motor temperature and motor characteristic.

In certain applications the optimum AES voltage needs to be adjusted in order to achieve optimum energy savings. Use the following AES parameters for manual adjustment:

11-21: Voltage limit value of AES commissioning operation

Sets the voltage upper limit during automatic energy saving. $100 \%$ corresponds to 220 V or 440 V depending on the inverter class used.

## Voltage limit value of commissioning operation

11-22: Adjustment time of automatic energy saving

Set sample time constant for measuring output power.
Reduce the value of 11-22 to increase response when the load changes.
Note: If the value of 11-22 is too low and the load is reduced the motor may become unstable.

11-23: Detection level of automatic energy saving
Set the automatic energy saving output power detection level.

11-24: Coefficient of automatic energy saving
The coefficient is used to tune the automatic energy saving. Adjust the coefficient while running the inverter on light load while monitoring the output power. A lower setting means lower output voltage.

## Notes:

- If the coefficient is set to low the motor may stall.
- Coefficient default value is based on the inverter rating. Set parameter 13-00. If the motor power does not match the inverter rating.

### 8.5 Emergency Stop

The emergency stop time is used in combination with multi-function digital input function \#14 (Emergency stop). When emergency stop input is activated the inverter will decelerate to a stop using the Emergency stop time (00-26) and display the [EM STOP] condition on the keypad.

Note: To cancel the emergency stop condition the run command has to be removed and emergency stop input deactivated.

Example: Emergency Stop Switch with NPN wiring set for input terminal S5 (03-04 = 14).

| $\mathbf{0 0 - 2 6}$ | Emergency stop time |
| :--- | :--- |
| Range | $0.1 \sim 6000.0 \mathrm{Sec}$ |

### 8.6 Forward and Reverse Jog

The jog forward command is used in combination with multi-function digital input function \#6 (Jog Forward) and the jog reverse command is used in combination with multi-function digital input function \#7 (Jog Reverse).

Example: Jog Forward input terminal S5 (03-04 = 06) and Jog Reverse input terminal S7 (03-06=7) with NPN wiring.

### 8.7 Direct / Unattended Startup

The unattended startup function prevents the inverter from starting automatically when a run command is present at time of power-up. To use USP command set one of the multi-function digital input functions to \#50 (USP Startup).

Unattended Startup Protection

### 8.8 Analog Output Setup

Signal: Use parameter 04-11 to select the analog output signal for AO1 and parameter $04-16$ to select the analog output signal for AO2.

Gain: Use parameter 04-12 to adjust the gain for AO1 and parameter 04-17 to adjust the gain for AO2. Adjust the gain so that the analog output ( 10 V ) matches $100 \%$ of the selected analog output signal (04-11 for AO1 and 04-16 for AO2).

Bias: Use parameter 04-13 to adjust the bias for AO1 and parameter 04-18 to adjust the bias for AO2. Adjust the bias so that the analog output ( 0 V ) matches $0 \%$ of the selected analog output signal (04-11 for AO1 and 04-16 for AO2).

## Example: Analog Output 1 Wiring

| 04-11 | AO1 function Setting |  |
| :--- | :--- | :--- |
|  | 0: Output frequency | 15: ASR output |
|  | 1: Frequency command | 16: Reserved |
|  | 2: Output voltage | 17: $q$-axis voltage |
|  | 3: DC voltage | 18: d-axis voltage |
|  | 4: Output current | 19: Reserved |
|  | 5: Output power | 20: Reserved |

| 04-20 | Filter Time of AO Signal Scan |
| :---: | :--- |
| Range | $0.00 \sim 0.50 \mathrm{~s}$ |

Analog output level adjustment

## Chapter 9 Using PID Control for Constant Flow / Pressure Applications

### 9.1 What is PID Control?

The PID function in the inverter can be used to maintain a constant process variable such as pressure, flow, temperature by regulating the output frequency (motor speed). A feedback device (transducer) signal is used to compare the actual process variable to a specified setpoint. The difference between the set-point and feedback signal is called the error signal.
The PID control tries to minimize this error to maintain a constant process variable by regulating the output frequency (motor speed).

The amplitude of the error can be adjusted with the Proportional Gain parameter 10-05 and is directly related to the output of the PID controller, so the larger gain the larger the output correction.

Example 1:
Gain = 1.0
Set-Point $=80 \%$
Feedback $=78 \%$
Error $=$ Set-point - Feedback $=2 \%$
Control Error = Gain x Error = 2\%

## Example 2:

Gain $=2.0$
Set-Point $=80 \%$
Feedback $=78 \%$
Error $=$ Set-point - Feedback $=2 \%$
Control Error = Gain x Error = 4\%

Please note that an excessive gain can make the system unstable and oscillation may occur.

The response time of the system can be adjusted with the Integral Gain set by parameter 10-06. Increasing the Integral Time will make the system less responsive and decreasing the Integral Gain Time will increase response but may result in instability of the total system.

Slowing the system down too much may be unsatisfactory for the process. The end result is that these two parameters in conjunction with the acceleration (00-14) and deceleration (00-15) times are adjusted to achieve optimum performance for a particular application.

For typical fan and pump applications a Proportional Gain (10-05) of 2.0 and an Integral Time (10-06) of 5.0 sec is recommended.

## 10-03 PID control mode

PID control can be enabled by setting parameter 10-03 to 'xxx1b'

| 10-03 | PID control mode |
| :---: | :---: |
| Range | xxx0b: PID disable <br> xxx1b: PID enable <br> xx0xb: PID positive characteristic <br> xx1xb: PID negative characteristic <br> x0xxb: PID error value of D control <br> x1xxb: PID feedback value of D control <br> 0xxxb: PID output <br> 1xxxb: PID output + frequency command |

## Commonly used PID control modes

0001b: Forward operation: PID operation enabled, motor speeds increases when feedback signal is smaller than set-point (most fan and pump applications)

0011b: Reverse operation: PID operation enabled, motor slows down when feedback signal is smaller than set-point (e.g. level control applications)

To set parameter 10-03:

- After power-up press the DSP/FUN key
- Set Group 10 (PID Control), and select parameter -03 with the UP/DOWN $\triangle$ and $\boldsymbol{\nabla}$ keys and press the READ/ ENTER key.

Important: To use the PID function parameter 00-05 (Main Frequency Command Source Selection) has to be set to 5 for PID reference.

### 9.2 Connect Transducer Feedback Signal (10-01)

The PID function in the inverter
Depending on the type of feedback transducer used, the inverter can be setup for either 0-10V or a 4-20mA feedback transducer.

Feedback Signal from Al2 (10-01 = 2), and set the input current to $\mathbf{4 - 2 0 m A} / \mathrm{SW} 2=1$

Feedback Signal from Al1 (10-01 = 1), and set the input voltage to $0-10 \mathrm{~V} / \mathrm{SW} 2=\mathrm{V}$

### 9.3 Engineering Units (only for LCD)

The PID setpoint scaling can be selected with parameter 16-03 and 16-04.
Example: 0 - 200.0 PSI Setpoint, set 16-03 to 12000 (1 decimal, range $0-200$ ) and 16-04 to 2 (PSI).

### 9.4 Sleep / Wakeup Function

The PID Sleep function can be used to prevent a system from running at low speeds and is frequently used in pumping application. The PID Sleep function is turned on by parameter 10-29 set to 1 . The inverter output turns off when the PID output falls below the PID sleep level (10-17) for the time specified in the PID sleep delay time parameter (10-18).

The inverter wakes up from a sleep condition when the PID output (Reference frequency) rises above the PID wake-up frequency (10-19) for the time specified in the PID wake-up delay time (10-20).
$10-29=0$ : PID Sleep function is disabled.
10-29 =1: PID sleep operation is based on parameters of 10-17 and 10-18.
10-29 =2: PID sleep mode is enabled by multi-function digital input

Refer to the following figures for PID sleep / wakeup operation.

PID Sleep Function

## Chapter 10 Troubleshooting and Fault Diagnostics

### 10.1 General

Inverter fault detection and early warning / self-diagnosis function. When the inverter detects a fault, a fault message is displayed on the keypad. The fault contact output energizes and the motor will coast to stop (The stop method can be selected for specific faults).

When the inverter detects a warning / self-diagnostics error, the digital operator will display a warning or self-diagnostic code, the fault output does not energize in this case. Once the warning is removed, the system will automatically return to its original state.

### 10.2 Fault Detection Function

When a fault occurs, please refer to Table 10.2.1 for possible causes and take appropriate measures.

Use one of the following methods to restart:

1. Set one of multi-function digital input terminals (03-00, 03-07) to 17 (Fault reset); activate input
2. Press the reset button on the keypad.
3. Power down inverter wait until keypad goes blank and power-up the inverter again.

When a fault occurs, the fault message is stored in the fault history (see group 12 parameters).
Table 10.2.1 Fault information and possible solutions

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
| over curre | The inverter output current exceeds the overcurrent level ( $200 \%$ of the inverter rated current). | - Acceleration / Deceleration time is too short. <br> - Contactor at the inverter output side. <br> - A special motor or applicable capacity is greater than the inverter rated value. <br> - Short circuit or ground fault. | - Extend acceleration / deceleration time. <br> - Check the motor wiring. <br> - Disconnect motor and try running inverter. |
|  |  |  |  |
| OCA over current | The inverter output current exceeds the overcurrent level in acceleration time | - Acceleration time is too short <br> - Capacity of motor is bigger than inverter <br> - Short circuit between winding and shell of motor <br> - Short circuit between wire and ground of motor <br> - IGBT broken module | - Set the longer acceleration time <br> -Change to bigger capacity of inverter <br> -Examine motor <br> -Check the wire <br> - Replace IGBT module |
|  |  |  |  |
| OCC over current | The inverter output current exceeds the overcurrent level in constant speed | - Instantaneous change of load <br> - Instantaneous change of current | -Change to bigger capacity of inverter <br> - Add reactor to power source |
|  |  |  |  |

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
| OCd over current ILD | The inverter output current exceeds the overcurrent level in deceleration time | -Deceleration time is too short | - Set the longer acceleration time |
| sc short circuit $5[$ | Inverter output short circuit or ground fault. | - Short circuit or ground fault (08-23 = 1). <br> - Motor damaged (insulation). <br> - Wire damage or deterioration. | - Check the motor wiring. <br> - Disconnect motor and try running inverter. |
| GF Ground fault <br> EII | The current to ground exceeds $50 \%$ of the inverter rated output current ( $08-23=1$, GF function is enabled). | - Motor damaged (insulation). <br> - Wire damage or deterioration. <br> - Inverter DCCT sensors defect. | - Replace motor. <br> - Check the motor wiring. <br> - Disconnect motor and try running inverter. <br> - Check resistance between cables and ground. <br> - Reduce carrier frequency. |
| OV <br> Over voltage <br> [ill | DC bus voltage exceeds the OV detection level: 200V class: 410Vdc 400 V class: 820 Vdc 575 V class: 1050 Vdc 690 V class: 1230 Vdc | - Deceleration time set too short, resulting in regenerative energy flowing back from motor to the inverter. <br> - The inverter input voltage is too high. <br> - Use of power factor correction capacitors. <br> - Excessive braking load. <br> - Braking transistor or resistor defective. <br> - Speed search parameters set incorrectly. | - Increase deceleration time <br> - Reduce input voltage to comply with the input voltage requirements or install an AC line reactor to lower the input voltage. <br> - Remove the power factor correction capacitor. <br> - Use dynamic braking unit. <br> - Replace braking transistor or resistor. <br> - Adjust speed search parameters. |
|  | DC bus voltage is lower than the UV detection level or the pre-charge contactor is not active while the inverter is running. 200 V class: 190 Vdc 400 V class: 380 Vdc 575/690V class: 546 Vdc (The detection value can be adjusted by 07-13). | - The input voltage is too low. <br> - Input phase loss. <br> - Acceleration time set too short. <br> - Input voltage fluctuation. <br> - Pre-charge contactor damaged. <br> - DC bus voltage feedback signal value not incorrect. | - Check the input voltage. <br> - Check input wiring. <br> - Increase acceleration time. <br> - Check power source <br> - Replace pre-charge contactor <br> - Replace control board or complete inverter. |
|  | Phase loss at the input side of the inverter or input voltage imbalance, active when 08-09 = 1 (enabled). | - Wiring loose in inverter input terminal. <br> - Momentary power loss. <br> - Input voltage imbalance. | - Check input wiring / faster screws. <br> - Check power supply. |

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
| OPL output phase loss | Phase loss at the output side of the inverter, active when $08-10=1$ (enabled). | - Wiring loose in inverter output terminal. <br> - Motor rated current is less than $10 \%$ of the inverter rated current. | - Check output wiring / faster screws. <br> - Check motor \& inverter rating. |
|  |  |  |  |
| OH 1 Heatsink overheat | The temperature of the heat sink is too high. Note: when OH 1 fault occurs three times within five minutes, it is required to wait 10 minutes before resetting the fault. | - Ambient temperature too high. <br> - cooling fan failed <br> - Carrier frequency set too high. <br> - Load too heavy. | - Install fan or AC to cool surroundings. <br> - Replace cooling fan. <br> - Reduce carrier frequency. <br> - Reduce load / Measure output current |
| III |  |  |  |
| $\begin{aligned} & \text { OL1 } \\ & \text { Motor } \end{aligned}$ overload | Internal motor overload protection tripped, active when protection curve $08-05=x x x 1$. | - Voltage setting V/F mode too high, resulting in over-excitation of the motor. <br> - Motor rated current (02-01) set incorrectly. <br> - Load too heavy. | - Check V/f curve. <br> - Check motor rated current <br> - Check and reduce motor load, check and operation duty cycle. |
|  |  |  |  |
| OL2 Inverter overload overload | Inverter thermal overload protection tripped. If an inverter overload occurs 4 times in five minutes, it is required to wait 4 minutes before resetting the fault. | - Voltage setting V/F mode too high, resulting in over-excitation of the motor. <br> - Inverter rating too small. <br> - Load too heavy. | - Check V/f curve. <br> - Replace inverter with larger rating. <br> - Check and reduce motor load, check and operation duty cycle. |
|  |  |  |  |
| OT Over torque detection | Inverter output torque is higher than 08-15 (over torque detection level) for the time specified in 08-16. Parameter 08-14 = 0 to activate. | - Load too heavy. | - Check over torque detection parameters (08-15 / 08-16). <br> - Check and reduce motor load, check and operation duty cycle. |
|  |  |  |  |
| UT Under torque detection | Inverter output torque is lower than 08-19 (under torque detection level) for the time specified in 08-20. Parameter 08-18 = 0 to activate. | - Sudden drop in load. <br> - Belt break. | - Check under torque detection parameters (08-19 / 08-20). <br> - Check load / application. |
| 1_12 |  |  |  |
|  | Switch for Motor1/Motor2 in running time | - Execute command for switching motor2 in running time <br> - Execute command for switching motor in running time | - Revise the sequence control and switch motor in top time. |
|  |  |  |  |
| OS Over speed | Motor speed exceeds level set in 20-20 (PG Over speed Level) for the time set in 20-21 (PG over speed time). Active when 20-19 (= 0 or 1). <br> This fault is active V/F + PG and SV control mode ( $00-00=1$ or 3 or 4 ). Motor speed can be monitored by 12-22 | - Motor speed overshoot (ASR) <br> - PG ppr set incorrectly. <br> - Overspeed parameters set incorrectly. | - Check ASR parameters group 21. <br> - Check PG parameters <br> - Check overspeed parameters 20-20/20-12. |
|  |  |  |  |

| LED display | Description | Cause | Possible solutions |
| :---: | :---: | :---: | :---: |
| PGO PG Open circuit | PG pulses are not received by the inverter for the time specified in 20-26 (PG open circuit detection time). This fault is active V/F + PG and SV control mode ( $00-00=1$ or 3 or 4 ). | - PG cable disconnected. <br> - PG has no power. <br> - Mechanical brake active preventing motor from turning. | - Check PG wiring. <br> - Check PG power-supply. <br> - Make sure brake is released. |
| 1 |  |  |  |
| DEV <br> Speed deviation | Motor speed rises above 20-23 level (PG speed deviation level) for the time specified in 20-24 (PG deviation time)...Active when parameter 20-22(=0 or 1). This fault is active V/F + PG and SV control mode ( $00-00=1$ or 3 or 4 ). | - Load too heavy <br> - Mechanical brake active preventing motor from turning. <br> - PG wiring error. <br> - PG parameters (group 20) set incorrectly. <br> - Acceleration / deceleration time set to short. | - Check load <br> - Make sure brake is released. <br> - Check PG wiring. <br> - Check PG parameters 20-23/20-24. <br> - Increase Acceleration / deceleration time. |
| EIE! |  |  |  |
| CE communicati on error | No Modbus communication received in for the time specified in 09-06 (communication error detection time). Active when 09-07( $=0$ to 2). | - Connection lost or wire broken. <br> - Host stopped communicating. | - Check connection <br> - Check host computer / software. |
| 1 |  |  |  |
| FB PID feedback loss | PID feedback signal falls below level specified in 10-12 (PID feedback loss detection level) for the time specified in 10-13 (Feedback loss detection time). Active when parameter (10-11 = 2). | - Feedback signal wire broken <br> - Feedback sensor broken. | - Check feedback wiring <br> - Replace feedback sensor. |
|  |  |  |  |
| STO <br> Safety switch | Run permissive input open. | - Terminal board Input F1 and F2 are not connected (For standard H \& C type) <br> - Terminal board Input SF1 / SF2 and SG are not connected (For enhanced E \& G type) <br> - 08-30 set to 1 ,free run to stop, and digital terminal is open, when 03-00~03-07=58 | - Check F1 and F2 connection. (For standard U type) <br> - Check SF1 / SF2 and SG connection (For enhanced UE type) <br> - Check if $08-30=0$ and 03-00~03-07=58 |
|  |  |  |  |
| STO2 <br> Safety switch |  |  |  |
| 1 |  |  |  |
| SS1 <br> Digital input Stop command | Digital input Stop command enabled | - $08-30=0$ and $03-00 \sim 03-07=58$ | - Check if $08-30=0$ and 03-00~03-07=58 |
| E1 |  |  |  |
| EFO <br> External fault <br> 0 <br> ED <br> EL | External fault (Modbus) | Modbus communication 0x2501 bit $2=" 1 "$ | - Reset Modbus communication 0x2501 bit $2=$ " 1 " |

| 口口三！ | 68，and Inverter external fault selection $08-24=0$ or 1 ． |  |  |

| LED display | Description | Possible causes | Corrective action |
| :---: | :---: | :---: | :---: |
|  | Motor control fault | - SLV mode is unable to run motor. | - Perform rotational or stationary auto-tune <br> - Increase minimum output frequency (01-08) |
| CF08 <br> Motor control <br> fault | Motor control fault | - Start or Run fault in PMSLV mode. | - Increase the value of 22-10 properly. <br> - Re auto-tune (22-21) <br> - Check if the load is too heavy to raise torque output limit. |
| FU <br> fuse openEII | DC bus fuse blown DC fuse (Models 200V 50 HP and above, 400 V 100HP and above) open circuit. | - IGBT damaged. <br> - Short circuit output terminals. | - Check IGBTs <br> - Check for short circuit at inverter output. <br> - Replace inverter. |
| CFOO Operator Communicati on Error | Errors of data transmission occur in LCD keypad. | - LCD keypad and inverter cannot transmit data after power on 5 seconds. | - Disconnect the operator and then reconnect. <br> - Replace the control board |
| CF01 Operator Communicati on Error 2 | Errors of data transmission occur in LCD keypad. | - LCD keypad and inverter can transmit data but transmission error occurs for more than 2 | - Disconnect the operator and then reconnect. |
| FEFI |  | onds |  |
| CTER CT Failure EIE | Errors of detecting voltages from three phase's current transformer to detect output current. | - Errors of detecting voltages <br> - Noises too much <br> - Control board failure | - Check current transformer signal and the voltage on the control board. |
| CF20 Communicati on Failure | Use Profibus \& Modbus Communication at the same time. | - Maybe use two kind of communication type at the same time. | - Check only use one kind of communication type. |
| PF <br> Protection Fault $\square$ - | OH1 error occurs for 3 times in 5 minutes when run command in multi-function digital input terminals is not removed. | - Run command in multi-function digital input terminals is not removed. | - Remove run command in multi-function digital input terminals. |
| TOL <br> External <br> Overload <br> EDL | External overload (enabled only when firemode activated | - External overload in multi-function digital input terminals. (Ex. Fan overheat) | - Check external overload. <br> - Reset external overload of digital input. |

### 10.3 Warning / Self-diagnosis Detection Function

When the inverter detects a warning, the keypad displays a warning code (flash).
Note: The fault contact output does not energize on a warning and the inverter continues operation. When the warning is no longer active the keypad will return to its original state.

When the inverter detected a programming error (for example two parameters contradict each other of are set to an invalid setting), the keypad displays a self-diagnostics code.

Note: The fault contact output does not energize on a self-diagnostics error. While a self-diagnostics code is active the inverter does not accept a run command until the programming error is corrected.

Note: When a warning or self- diagnostic error is active the warning or error code will flash on the keypad. When the RESET key is pressed, the warning message (flash) disappears and returns after 5 sec. If the warning or self-diagnostic error still exists.

Refer to Table 10.3.1 for and overview, cause and corrective action for inverter warnings and self-diagnostic errors.

Table 10.3.1 warning / self-diagnosis and corrective actions

| LED display | Description | Possible causes | Corrective action |

### 10.4 Auto-tuning Error

When a fault occurs during auto-tuning of a standard AC motor, the display will show the "AtErr" fault and the motor stops. The fault information is displayed in parameter 17-11.
Note: The fault contact output does not energize with an auto-tuning fault. Refer to Table 10.4.1, for fault information during tuning, cause and corrective action.

Table 10.4.1 Auto-tuning fault and corrective actions

| Error | Description | Cause | Corrective action |
| :---: | :---: | :---: | :---: |
| 01 | Motor data input error. | - Motor Input data error during auto-tuning. <br> - Inverter output current does not match motor rated current. | - Check the motor tuning data (17-00 to 17-09). <br> - Check inverter capacity |
| 02 | Motor lead to lead resistance R1 tuning error. | - Auto-tuning is not completed within the specified time <br> - Auto-tuning results fall outside parameter setting range. <br> - Motor rated current exceeded. <br> - Motor was disconnected. | - Check the motor tuning data (17-00 to 17-09). <br> - Check motor connection. <br> - Disconnect motor load. <br> - Check inverter current detection circuit and DCCTs. <br> - Check motor installation. |
| 03 | Motor leakage inductance tuning error. |  |  |
| 04 | Motor rotor resistance R2 tuning error. |  |  |
| 05 | Motor mutual inductance Lm tuning error. |  |  |
| 07 | Deadtime compensation detection error |  |  |
| 06 | Motor encoder error | - PG feedback noise | - Check motor rated current. <br> - Check PG card grounding. |
| 08 | Motor acceleration error (Rotational type auto-tuning only). | - Motor fails to accelerate in the specified time (00-14= 20sec). | - Increase acceleration time (00-14). <br> - Disconnect motor load. |
| 09 | Other | - No load current is higher than $70 \%$ of the motor rated current. <br> - Torque reference exceeds 100\%. <br> - Errors other than ATE01~ATE08. | - Check the motor tuning data (17-00 to 17-09). <br> - Check motor connection. |

### 10.5 PM Motor Auto-tuning Error

When a fault occurs during auto-tuning of a PM motor, the display will show the "IPErr" fault and the motor stops. The fault information is displayed in parameter 22-18.
Note: The fault contact output does not energize with an auto-tuning fault. Refer to Table 10.5.1, for fault information during tuning, cause and corrective action.

Table 10.5.1 Auto-tuning fault and corrective actions for PM motor

| Error | Description | Cause | Corrective action |
| :---: | :---: | :---: | :---: |
| 01 | Magnetic pole alignment tuning failure (static). | - Inverter output current does not match motor current. | - Check the motor tuning data (22-02). <br> - Check inverter capacity |
| 02 | PG option missing. | - Magnetic pole cannot be aligned without PG option card. | - Install PG feedback card. |
| 03 | Magnetic pole alignment auto-tuning abort during rotational auto-tune. | - System abnormality during magnetic pole alignment. | - Check for active protection functions preventing auto-tuning. |
| 04 | Timeout during magnetic pole alignment during rotational auto-tune. | - Motor cannot rotate | - Check motor. <br> - Check motor wiring. <br> - Check brake released. |
| 05 | Circuit tuning time out. | - System abnormality during circuit tuning. | - Check for active protection functions preventing auto-tuning. |
| 06 | Encoder error | - PG feedback noise | - Check motor rated current. <br> - Check PG card grounding. |
| 07 | Warning | - Other motor tuning error | - Check the motor tuning data (22-02). <br> - Check motor connection. |
| 08 | Motor current out of range during magnetic pole alignment (rotational auto-tune). | - Motor cannot operate at low speeds. | - Check PG card wiring <br> - Check motor connection. |
| 09 | Current out of range during circuit tuning. | - Inverter output current does not match motor current. | - Check the motor tuning data (22-02). <br> - Check inverter capacity |
| 10 | Magnetic pole alignment and circuit tuning failed. | - Auto-tuning is not successful. | - Retry magnetic pole alignment and circuit tuning. |

### 10.6 General troubleshooting

| Status | Checking point | Remedy |
| :--- | :--- | :--- |
| Motor runs in <br> wrong <br> direction | Is the wiring for the output terminals <br> correct? | Wiring must match U, V, and W terminals of the motor. |
|  | Is the wiring for forward and reverse <br> signals correct? | Check for correct wiring. |
|  | Is the wiring for the analog frequency <br> inputs correct? | Is the setting of operation mode <br> correct? |
|  | Is the load too excessive? | Check the Frequency Source set in parameters <br> 00-05/00-06. |
| Motor running <br> speed too high <br> or too low | Check the motor specifications <br> (poles, voltage...) correct? | Reduce the load. |
|  | Is the gear ratio correct? | Confirm the motor specifications. |
|  | Confirm the gear ratio. |  |
|  | Confirm the highest output frequency |  |
|  | Is the load too excessive? | Roes the load vary excessively? | | 1.Minimize the variation of the load. |
| :--- |
| 2.Consider increasing the capacities of the inverter |
| and the motor. |

### 10.7 Troubleshooting of the Inverter

### 10.7.1 Quick troubleshooting of the Inverter

### 10.7.2 Troubleshooting for OC, OL error displays

### 10.7.3 Troubleshooting for OV, LV error

### 10.7.4 The motor can not run

### 10.7.5 Motor Overheating

### 10.7.6 Motor runs unbalanced

### 10.8 Routine and periodic inspection

To ensure stable and safe operations, check and maintain the inverter at regular intervals.
Use the checklist below to carry out inspection.
Disconnect power after approximately 5 minutes to make sure no voltage is present on the output terminals before any inspection or maintenance.

| Items | Details |  | king iod | Methods | Criteria | Remedies |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Daily | 1Year |  |  |  |
| Environment \& Ground connection |  |  |  |  |  |  |
| Ambient conditions at the installation | Confirm the temperature and humidity at the machine | $\bigcirc$ |  | Measure with thermometer and hygrometer | $\begin{array}{\|l} \hline \text { Temperature: } \\ -10 \sim 40^{\circ} \mathrm{C} / 50^{\circ} \mathrm{C} \\ \left(14 \sim 104^{\circ} \mathrm{F}\right) /\left(122^{\circ} \mathrm{F}\right) \\ \text { Humidity: Below } \\ \text { 95\%RH } \\ \hline \end{array}$ | Improve the ambient or relocate the drive to a better area. |
| Installation Grounding | Is the grounding resistance correct? |  | $\bigcirc$ | Measure the resistance with a multi-tester | 200VClass: below $100 \Omega$ | Improve the grounding if needed. |
| Terminals \& Wiring |  |  |  |  |  |  |
| Connection terminals | Any loose parts or terminals? |  | $\bigcirc$ | Visual check Check with a screwdriver | Correct installation requirement | Secure terminals and remove rust |
|  | Any damage to the base? |  | $\bigcirc$ |  |  |  |
|  | Any corroded Terminals? |  | $\bigcirc$ |  |  |  |
| Wiring | Any broken wires? |  | $\bigcirc$ | Visual check | Correct wiring requirement | Rectify as necessary |
|  | Any damage to the wire insulation? |  | $\bigcirc$ |  |  |  |
| voltage |  |  |  |  |  |  |
| Input power voltage | Is the voltage of the main circuit correct? | $\bigcirc$ |  | Measure the voltage with a multi-tester | Voltage must conform with the spec. | Improve input voltage if necessary. |
| Circuit boards and components |  |  |  |  |  |  |
| Printed circuit board | Any contamination or damage to printed circuit board? |  | $\bigcirc$ | Visual check | Correct component condition | Clean or replace the circuit board |
| Power component | Any dust or debris |  | $\bigcirc$ |  |  | Clean components |
|  | Check resistance between terminals |  | $\bigcirc$ | Measure with a multi-tester | No short circuit or broken circuit in three phase output | Consult with the supplier |
| Cooling System |  |  |  |  |  |  |
| Cooling fan | Unusual vibration and noise? |  | $\bigcirc$ | Visual and sound check | Correct cooling | Consult with the supplier |
|  | Excessive dust or debris | $\bigcirc$ |  | Visual check |  | Clean the fan |
| Heat sink | Excessive dust or debris | $\bigcirc$ |  |  |  | Clean up debris or dust |
| Ventilation Path | Is the ventilation path blocked? | $\bigcirc$ |  |  |  | Clear the path |

### 10.9 Maintenance

To ensure long-term reliability, follow the instructions below to perform regular inspection. Turn the power off and wait for a minimum of 5 minutes before inspection to avoid potential shock hazard from the charge stored in high-capacity capacitors.

## 1. Maintenance Check List.

$>$ Ensure that temperature and humidity around the inverters is as required in the instruction manual, installed away from any sources of heat and the correct ventilation is provided..
$>$ For replacement of a failed or damaged inverter consult with the local supplier.
Ensure that the installation area is free from dust and any other contamination.
Check and ensure that the ground connections are secure and correct.
Terminal screws must be tight, especially on the power input and output of the inverter.
Do not perform any insulation test on the control circuit.

## 2. Insulation test Method .

## Single Phase

## Three Phase

## Chapter 11 Inverter Peripheral devices and Options

### 11.1 Braking Resistors and Braking Units

Inverters ratings 200V $1 \sim 25 \mathrm{HP} / 400 \mathrm{~V} 1 \sim 40 \mathrm{HP} / 575 \mathrm{~V}$ 1~10HP/600V 15~40HP have a built-in braking transistor. For applications requiring a greater braking torque an external braking resistor can be connected to terminals B1 / P and B2; for inverter ratings above 200V 30HP / 400V 50HP/600V 50 HP , an external braking unit (connected to $\oplus-\ominus$ of the inverter) and a braking resistor (connected to two ends of the detection module $\mathrm{BR} \oplus-\mathrm{BR} \ominus$ ) is required.

Table 11.1.1 List of braking resistors and braking units

| Inverter |  |  | Braking unit |  | Braking resistor |  |  |  |  | Braking torque (Peak / Continues) 10\%ED | Minimum <br> Resistance ${ }^{* 1}$ |  |

Note1: The spec. please refer to Chapter 3.18, the rated current is 330/370A.
Note2: " 2 in parallel" means that need to use 2 set of braking resistor and to be connected in parallel, then connected to braking unit. For example, 400V class 100HP, it need TBU-4120 for 1 and $6000 \mathrm{~W} / 20 \Omega$ for 2 , the braking resistor need to be connected in parallel, after the connection, the braking resistor is $12000 \mathrm{~W} / 10 \Omega$.
*Note: UE version of A510-4040-C3-UE may not include braking resistor. Contact Factory.

*1: Minimum resistance is the acceptable minimum value of the braking resistor for a single braking unit.
Note: Keep sufficient space between inverter, braking unit and braking resistor and ensure proper cooling is provided for.

Fuse type: Choose semiconductor fuse to comply with UL.
Voltage Range:
For 200 V class inverter, use 300 V class fuse.
For 400 V class inverter, use 600 V class fuse.

### 11.5 PG Speed Feedback Card

## A) JN5-PG-O speed feedback card: Open collector speed feedback card

## JN5-PG-O terminal specification:

| Terminal Name | Description |
| :--- | :--- |
| Vcc | Power supply for encoder. <br> 12 V or $5 \mathrm{~V} \pm 5 \%, 200 \mathrm{~mA}$ Maximum <br> $(12 \mathrm{~V}$ or 5 V input voltage selected by the Switch Jumper. Can't <br> use both 12 V and 5 V at the same time) |
| GND (OV Common Terminal) | Encoder input signal, two-phase input is required for correct <br> divider ratio output. Open collector input type. |
| A, /A, B, /B, Z, /Z | A ,B phase divider ratio output, z phase output monitor, <br> Open collector type: $24 \mathrm{~V}, 30 \mathrm{~mA}$. |
| AO, /AO, BO, /BO, ZO, /ZO | Grounding Terminal. |
| E |  |

JN5-PG-O block diagram:

## B) JN5-PG-L / JN5-PG-L-24 speed feedback card: Line driver speed feedback card

## JN5-PG-L / JN5-PG-L-24 terminal specification

| Terminal Name | Description |
| :--- | :--- |
| Vcc | Power supply for encoder. <br> 12 V or $5 \mathrm{~V} \pm 5 \%, 200 \mathrm{~mA}$ Maximum <br> $(12 \mathrm{~V}$ or 5 V input voltage selected by the Switch Jumper. Can't <br> use both 12 V and 5 V at the same time) |
| GND (OV Common Terminal) | Encoder input signal, A correct divider ratio output requires a <br> two-phase input. Line driver input type, RS-422 level input. |
| A, /A, B, /B, Z, /Z | A ,B phase divider ratio output, z phase output monitor, <br> Line driver output type, RS-422 level output. |
| AO, /AO, BO, /BO, ZO, /ZO | Grounding terminal. |
| E |  |

Note: The AO, /AO, BO, /BO, ZO, /ZO of JN5-PG-L-24 are open collector type output.
JN5-PG-L / JN5-PG-L-24 block diagram:

## C) JN5-PG-PM speed feedback card: synchronous motor line driver speed feedback card

## JN5-PG-PM terminal specification

| Terminal Name | Description |
| :---: | :---: |
| Vcc | Power supply for encoder. $5 \mathrm{~V} \pm 5 \%$, 200mA Maximum |
| GND (0V Common Terminal) |  |
| $\begin{aligned} & \mathrm{A}, / \mathrm{A}, \mathrm{~B}, / \mathrm{B}, \mathrm{Z}, / \mathrm{Z} \\ & \mathrm{U}, / \mathrm{U}, \mathrm{~V}, / \mathrm{V}, \mathrm{Z}, / \mathrm{Z} \end{aligned}$ | Encoder input signal, A correct divider ratio output requires a two-phase input. <br> Line driver input type, RS-422 level input. |
| AO, /AO, BO, /BO, ZO, /ZO | $\mathrm{A}, \mathrm{B}$ phase divider ratio output, z phase output monitor, Line driver output type, RS-422 level output. |
| E | Grounding terminal. |

## JN5-PG-PM block diagram:

## D) JN5-PG-PMR speed feedback card with TAMAGAWA Resolver Encoder

## JN5-PG-PMR terminal specification

| Terminal Name | Description |
| :--- | :--- |
| R+, R- | Excitation signal to Resolver. 7Vrms, 10KHz. |
| S1, S3 | COS signals from Resolver. |
| S2, S4 | SIN signals from Resolver. |
| $\mathbf{a + ,} \mathbf{a -}, \mathbf{b +}, \mathbf{b -}, \mathbf{z +}, \mathbf{z -}$ | A,B,Z pulse Monitor signal output, <br> Line driver output Type,RS-422 level. |
| E | Grounding terminal |

E) JN5-PG-PMS/JN5-PG-PMS-24 speed feedback card with Heidenhain ERN 1387

## Encoder

JN5-PG-PMS / JN5-PG-PMS-24 terminal specification

| Terminal Name | Description |
| :---: | :--- |
| E5V | Power supply for encoder. $5 \mathrm{~V} \pm 5 \%, 200 \mathrm{~mA}$ |
| GND | 0V Common Terminal |
| C+,C- | input C pulse from the encoder, $\mathrm{Vp}-\mathrm{p}=0.6 \sim 1.2 \mathrm{~V}$ |
| D+, D- | input D pulse from the encoder, $\mathrm{Vp}-\mathrm{p}=0.6 \sim 1.2 \mathrm{~V}$ |
| A+, A- | input A pulse from the encoder, $\mathrm{Vp}-\mathrm{p}=0.6 \sim 1.2 \mathrm{~V}$, fmax $=20 \mathrm{KHz}$ |
| B+, B- | input B pulse from the encoder, $\mathrm{Vp}-\mathrm{p}=0.6 \sim 1.2 \mathrm{~V}$, fmax $=20 \mathrm{KHz}$ |
| R+, R- | input R pulse (encoder home pulse) |
| a+, a- | output a ratio of the A pulse frequency |
| $\mathbf{b +}, \mathbf{b}-$ | output b ratio of the B pulse frequency |

Note: The $a+, a-, b+, b-$ of JN5-PG-PMS-24 are open collector type output.

F. JN5-PG-PMC/JN5-PG-PMC-24 speed feedback card with Heidenhain ECN 1313 Encoder
JN5-PG-PMC / JN5-PG-PMC-24 terminal specification

| Terminal Name | Description |
| :---: | :--- |
| E5V | Power supply for encoder. $5 \mathrm{~V} \pm 5 \%, 200 \mathrm{~mA}$ |
| GND | OV Common Terminal |
| DATA+/- | Bi-direct data for the encoder, RS485 driver. |
| CLOCK +- | output clock to the encoder, line driver RS422 output |
| A+, A- | input A pulse from the encoder, $\mathrm{Vp-p=}=0.6 \sim 1.2 \mathrm{~V}$, fmax $=20 \mathrm{KHz}$ |
| B+, B- | input B pulse from the encoder, $\mathrm{Vp-p=}=0.6 \sim 1.2 \mathrm{~V}$, fmax $=20 \mathrm{KHz}$ |
| $\mathbf{a +} / \mathbf{a}-$, $\mathbf{b}+\mathbf{b}-$ | line driver RS422 output( a ratio of the A,B pulse frequency) |

Note: The a+, a-, b+, b- of JN5-PG-PMS-24 are open collector type output.

ENCORDER
JN5-PG-PMC

### 11.6 Other Options

## A. Blank cover and keypad extension cable

When used for remote control purposes, the keypad can be removed and remotely connected with an extension cable. Extension cables are available in the following lengths: 1 m ( 3.3 ft ), 2 m ( 6.6 ft ), 3 m ( 10 ft ), and 5 m (16.4ft).

| Name | Model | Specification |
| :---: | :---: | :---: |
| LED digital <br> operator wire <br> with blank <br> cover | JN5-CB-01MK | $\mathbf{1 m}$ (3.3ft) |
|  | JN5-CB-02MK | $\mathbf{2 m}$ (6.6ft) |
|  | JN5-CB-05MK | $\mathbf{5 m}(\mathbf{1 6 . 4 f t})$ |

Remote control
When using a remote mount keypad a blank cover can be installed in place of the original keypad to prevent dust and debris from entering the inverter.

Blank keypad cover

| Name | Model | Specification |
| :---: | :---: | :---: |
| Blank cover | JN5-OP-A03 | Blank cover |

| Name | Model | Specification |
| :---: | :---: | :---: |
| LED digital <br> operator wire | JN5-CB-01M | $\mathbf{1 m}(\mathbf{3 . 3 f t})$ |
|  | JN5-CB-02M | $\mathbf{2 m}(\mathbf{6 . 6 f t})$ |
|  | JN5-CB-05M | $\mathbf{5 m}(\mathbf{1 6 . 4 f t})$ |

## LED/LCD keypad dimensions

## B. Copy Unit (JN5-CU) *NOTE STANDARD LCD KEYPAD IS ALSO A COPY UNIT*

The copy unit is used to copy an inverter parameter setup to another inverter. The copy unit saves time in applications with multiple inverters requiring the same parameter setup.

Copy Unit (JN5-CU) dimensions and appearance

## C. Option Protective Cover *Not Standard for US Market*

The installation environment will have a direct affect on the correct operation and the life span of the inverter. To obtain maximum service life inverter shall be installed in a suitable environment as specified in this manual. Chapter 3.1.

Option cover may be used to provide protection against external objects entering the unit and restrict dust ingress. No temperature derate is necessary.

## Option cover part numbers(not in the US market):

| Frame | Model |
| :---: | :---: |
| 1 | JN5-CR-A01 |
| 2 | JN5-CR-A02 |
| 4 | JN5-CR-A04 |

### 11.7 NEMA1 Kit

If NEMA1 or IP20 protective level is necessary to upgrade, it is recommended to purchase the NEMA1 kit positioned on top and bottom sides of the inverter. The drawings installed in the inverter, please refer to chapter 3.7.

| Frame | Model |
| :---: | :---: |
| 6 | JN5-NK-A06 |
| 7 | JN5-NK-A07 |
| 8 | JN5-NK-A08 |

## Appendix A: Communication Networks

## A1.1 RS485 -Network (Modbus)

This section shows a RS485 network consisting of several inverters communicating using the built-in Modbus RTU protocol.

Wiring diagram RS485 Modbus RTU Network

## Notes:

- A PC / PLC controller with a built-in RS-485 interface can be connected directly to the RS-485 network. Use a RS232 to RS485 converter to connect a PC / PLC with a built-in RS-232 interface.
- A maximum of 31 inverters can be connected to the network. Terminating resistors of 120 ohm must be installed at both end of the network.

Refer to A510s RS-485 Modbus communication manual for more information.

## A1.2 Profibus DP Network (expansion card)

## A1.2.1 Communication hardware and data structure

This product is the PROFIBUS high-speed communication expansion module; it can perform remote setting and communication functions through the PROFIBUS bus. It is used on the TECO A510s/F510 AC motor driver (hereinafter referred to as the "driver"), and allows the driver to operate on the PROFIBUS network.

## A1.2.2 Product specifications

## PROFIBUS ports

| Item | Specifications |
| :---: | :--- |
| Connector | DB-9 |
| Transmission <br> rate | $9.6 \mathrm{Kbit} /$ s to 12Mbit/s (automatic detection of transmission rate) |
| Network <br> protocols | PROFIBUS communication protocol |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Control board CN2 connector |
| Transmission <br> method | SPI high speed communication |
| Terminal <br> functions | 1. The communication module communicates with the AC motor <br> driver through this interface. <br> 2. The AC motor driver provides power to the communication <br> module through this interface. |
| Communication <br> protocols | TECO communication protocol |

## A1.2.3 Installation instructions

## PROFIBUS network connection

Definitions of PROFIBUS DP communication port pins are as shown in the figure below.

| $\begin{array}{ll} 9^{9} & 0^{5} \\ 8_{0} & 0^{4} \\ 0 & 0^{3} \\ { }^{7} 0 & 0^{2} \\ 6 & 0 \\ & 0 \end{array}$ |  | Pin | Definition | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 1~2 | Not assigned | - |
|  |  | 3 | RXD/TXD-P (BLine) | Receive/Send data -P |
|  |  | 4 | Not assigned |  |
|  |  | 5 | DGND (2M) | Data reference potential |
|  |  | 6~7 | Not assigned |  |
|  |  | 8 | RXD/TXD-N (A-Line) | Receive/Send data -N |
|  |  | 9 | Not assigned | - |

## PROFIBUS network connection

As shown in the figure below, ID addresses (1~125) correspond to SW1 b1~b7.

| Function | DIP switch <br> position | DIP switch <br> status | Description |
| :---: | :---: | :---: | :---: |
| Network <br> address <br> setting | b1~b7 | 0100000 | Network <br> address is 1 <br> address is 2 |
|  |  | 1100000 | Network <br> address is 3 |
|  |  | $\ldots \ldots . . . .$. | $\ldots \ldots$. |

|  |  | 1011111 | Network <br> address is 125 |
| :---: | :---: | :---: | :---: |
| No function | b8 | - | - |

Network address switch setting range: 1~125 (0, 128~255 cannot be used).

## PROFIBUS bus terminal resistor

## A1.2.4 LED indicator descriptions

The module has two dual-color LED indicators built-in used to quickly diagnose and monitor the communication statuses between the module itself and the bus.

## Module status LED (RUN LED \& ERR LED)

Used to monitor whether the equipment is operating normally.

| Indicator <br> statuses | Description |
| :---: | :---: |
| Does not light <br> up | Power not supplied |
| Orange light <br> lights up | Communication with the <br> frequency converter not <br> established |

| Red light flashes <br> $(1 \mathrm{~Hz})$ | Communication error <br> with the frequency <br> converter |
| :---: | :---: |
| Red light flashes <br> $(4 \mathrm{~Hz})$ | Flip-switch ID address <br> error |
| Green light <br> flashes (4 Hz) | Power supply normal <br> but DP communication <br> not established |
| Green light <br> lights up | DP communication <br> normal |

## Network status LED (COMM LED)

Used to monitor the operability of the communication module PROFIBUS network.

| Indicator <br> statuses | Description |
| :---: | :---: |
| Does not light <br> up | DP communication <br> not established |
| Green light <br> lights up | DP communication <br> established and <br> normal |

## A1.2.5 Driver parameter setting descriptions

Used to monitor the operability of the communication module PROFIBUS network.
Users must first confirm related parameter settings on the driver in order to ensure that the communication module can connect normally.

| Parameters | Parameter name | Settings | Settings descriptions |
| :---: | :---: | :---: | :---: |
| $00-02$ | Operation command source | 2 | Communication control |
| $00-05$ | Frequency command source | 3 | Communication control |

## A1.2.6 Connection instructions

PPO communication

| PKW |  |  |  | PZD |  |  |  |  |  |  |  |  |  |

| 1st <br> word | 2nd <br> word | $\begin{aligned} & 3 \text { 3rd } \\ & \text { word } \end{aligned}$ | 4th <br> word | 1st <br> word | $\begin{aligned} & \text { 2nd } \\ & \text { word } \end{aligned}$ | $\begin{aligned} & \text { 3rd } \\ & \text { word } \end{aligned}$ | $\begin{aligned} & \text { 4th } \\ & \text { word } \end{aligned}$ | $\begin{aligned} & 5 \text { th } \\ & \text { word } \end{aligned}$ | $\begin{aligned} & \text { 6th } \\ & \text { word } \end{aligned}$ | $\begin{aligned} & \text { 7th } \\ & \text { word } \end{aligned}$ | 8th <br> word | 9th <br> word | 10th word |
| PPO1 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| PPO2 |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | PPO4 |  |  |  |  |  |  |  |  |  |
| PPO5 |  |  |  |  |  |  |  |  |  |  |  |  |  |

| PKW: Parameter address/value | STW: Control word |
| :--- | :--- |
| PZD: Process data | ZSW: Status word |
| PKE: Parameter address | HSW: Main settings |
| IND: Subindex | HIW: Main actual value |
| PWE: Parameter value |  |

## PZD Structure default

User parameters of the communication module configured through the GSD file.
Default values of the PZD structure are as follows:
STW1 Control word; mapped to the MODBUS address 0x2501 of the driver.
HSW Main setting value; mapped to the MODBUS address 0x2502 of the driver.
ZSW1 Status word; mapped to the MODBUS address $0 \times 2520$ of the driver.
HIW Main actual value; mapped to the MODBUS address 0x2524 of the driver.

PLC Master station $\rightarrow$ driver slave station
PZD3/ PZD4: Not used.

Driver slave station $\rightarrow$ PLC master station
Driver output status; mapped to the MODBUS addresses $0 \times 2520 \sim 0 \times 252 F$ of the driver. The default values of PZD3/PZD4/PZD5/PZD6 are set as follows:
PZD3: Default multi-function terminal block on/off status; mapped to the MODBUS
address $0 \times 2522$ of the driver.
PZD4: Default output current; mapped to the MODBUS address $0 \times 2527$ of the driver.
PZD5: Default output current; mapped to the MODBUS address $0 \times 2521$ of the driver.

PZD6: Default output current; mapped to the MODBUS address $0 \times 2528$ of the driver.

## A1.2.7 Meanings of each character

Control character

| Bit | Description | 1 | 0 |
| :---: | :--- | :---: | :---: |
| 0 | Operation command | Operate | Stop |
| 1 | Reverse command | Reverse | Forward |
| 2 | External error | Error | - |
| 3 | Error reset | Reset | - |
| $4 \sim 5$ | Reserved | - | - |
| 6 | Multi-function terminal S1 | ON | OFF |
| 7 | Multi-function terminal S2 | ON | OFF |
| 8 | Multi-function terminal S3 | ON | OFF |
| 9 | Multi-function terminal S4 | ON | OFF |
| A | Multi-function terminal S5 | ON | OFF |
| B | Multi-function terminal S6 | ON | OFF |
| C | Multi-function terminal S7 | ON | OFF |
| D | Multi-function terminal S8 | ON | OFF |
| E | Controller mode | ON | OFF |
| F | Communication setting torque <br> command | ON |  |

Status character

| Bit | Meaning | 1 | 0 |
| :---: | :--- | :---: | :---: |
| 0 | Operation status | Operate | Stop |
| 1 | Direction status | Reverse | Forward |
| 2 | Frequency converter operation <br> preparation status | Preparation <br> complete | Not yet <br> prepared |
| 3 | Error | Abnormal | Normal |
| 4 | Warning | ON | OFF |
| 5 | Zero speed | ON | OFF |
| 6 | Model 440 | ON | OFF |
| 7 | Frequency reached | ON | OFF |
| 8 | Any frequency reached | ON | OFF |
| 9 | Frequency detection one | ON | OFF |
| A | Frequency detection two | ON | OFF |
| B | Low voltage | ON | OFF |
| C | Frequency converter no output | ON | OFF |

| D | Frequency not according to <br> communication | ON | OFF |
| :---: | :--- | :---: | :---: |
| E | SeqNotFromComm | ON | OFF |
| F | Over-torque | ON | OFF |

## A1.2.8 PKW regional access parameters

The driver can provide request and response information. Due to the request and response mechanism, the master station must send requests until a communication response is received. The 4 characters of the PKW region are as follows:

## PKE

Bit 0~11 (PNU): Parameter address/MODBUS address that includes related parameters.
Parameter address/MODBUS address: Please refer to the MODBUS
communication protocol description chapter in the driver manual for the register numbers, registers and data format that corresponds to the operation parameters. Bit 12~15 (AK): Includes the identification characters of requests or responses.

## Request character AK

PLC master station $\rightarrow$ driver slave station

| Request Identifier | Description |
| :---: | :--- |
| 0 | No request |
| 1 | Read parameter value |
| 2 | Modify parameter value |

## Response character AK

Driver slave station $\rightarrow$ PLC master station

| Request Identifier | Description |
| :---: | :--- |
| 0 | No response |
| 1 | Request parameter value processed |
| 7 | Request parameter value cannot process |

## Error character

If the request parameter value was not processed, then the error codes that will be kept in the low-bit PWE1 set are as follows:

| Error <br> code | Description |
| :---: | :--- |
| 0 | Parameter does not exist |
| 1 | The current status parameter cannot be <br> read/written |
| 2 | Parameter value not within range |
| 101 | Other SP communication error occurred, such as: <br> response timeout |

## PWE

Driver parameters are sent through PWE2 (4th word). In the following example, PWEI (3rd word) must be set as 0 in the PROFIBUS master station.

## Example of the PKW mechanism:

For example: Read parameters 00-05 (frequency command source).
Read the values of 00-05; first set the request identification character as 1 , and then refer to the MODBUS communication protocol description chapter in the driver manual to find out that the address of 00-05 is $0 \times 0005$, then the data sequences are as follows:

PLC master station $\rightarrow$ driver slave station: 1000000500000000
Driver slave station $\rightarrow$ PLC master station: 1000000500000004

| Request |  |
| :--- | :--- |
| 1st word <br> (PKE) | 1000 |

| Response |  |
| :--- | :--- |
| 1st word (PKE) | 1000 |

| 2nd word <br> (IND) | 0005 |
| :--- | :---: |
| 3rd word <br> (PWE1) | 0000 |
| 4th word <br> (PWE2) | 0000 |

| 2nd word (IND) | 0005 |
| :--- | :---: |
| 3rd word (PWE1) | 0000 |
| 4th word (PWE2) | 0004 |

## A1.2.9 Troubleshooting

There are two indicators on top of the PROFIBUS communication module; when malfunction occurs, the cause of the malfunction can be confirmed based on the indicator statuses, and troubleshoot the error by following the descriptions below.

## Indicator troubleshooting

## Module status LED

| Indicator <br> statuses | Status name | Troubleshooting method |
| :---: | :---: | :--- |
| Does not light <br> up | Power not <br> supplied to <br> the <br> communicat <br> ion module | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the driver. |
| Red and green <br> light flashes <br> alternately | Self-check | 1. The host is under self-check; if it flashes <br> continuously, disconnect the power and then reconnect <br> it. <br> 2. Confirm whether the driver communication <br> connection parameters are properly set (19200, 8, N, 1) |
| Green light <br> flashes | the <br> communicat <br> ion module <br> Standby | 1. Not yet connected with the driver. |

## Network status LED

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :--- |
| Does not light <br> up | Power not <br> supplied | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the driver. |

## A1.2.10 GSD File

When using the Profibus communication module, if the GSD description file (JN5-CMHI-PDP_V (latest version).GSD) is needed, please download it from the TECO official website or request for it from your purchasing sales channel.

### 11.10 CANopen high speed communication

 expansion card
### 11.10.1 Communication hardware and data structure

This product is the CANopen high-speed communication expansion module; it can perform remote setting and communication functions through the CANopen bus. It can only be used with the TECO A510s/F510 AC motor driver (hereinafter referred to as the "driver"), and allow the driver to operate on the CANopen network.

### 11.10.2 Product specifications

CANopen ports

| Item | Specifications |
| :---: | :--- |
| Connector | 5-pin open pluggable connector; pin spacing 5.08mm |
| Transmission <br> rate | $10 \mathrm{kbps}, 20 \mathrm{kbps}, 50 \mathrm{kbps}, 125 \mathrm{kbps}, 250 \mathrm{kbps}, 500 \mathrm{kbps}, 800 \mathrm{kbps}$, <br> 1 Mbps |
| Network <br> protocols | CANopen communication protocol |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Control board CN2 connector |
| Transmission <br> method | SPI high speed communication |
| Terminal <br> functions | 1. The communication module communicates with the AC motor <br> driver through this interface. <br> 2. The AC motor driver provides power to the communication <br> module through this interface. |
| Communication <br> protocols | TECO communication protocol |

### 11.10.3 Installation instructions

## Communication module contact description

As shown in the figure below, A - Terminal block (TB1)

B, C-Mounting holes
D - RUN LED
E - ERR LED
F - Control board connector (CN2)

## Terminal block definition

As shown in the figure below, the contact definitions in the order from left to right are GND, CAN_L, NC, CAN_H and NC.

## ID address setting description

As shown in the figure below, ID addresses (1~127) correspond to SW1 b1~b7.

Transmission rate corresponds to SW2 b1~b3.

| Function | DIP switch position | $\begin{aligned} & \text { DIP switch } \\ & \text { status } \\ & 7654321 \end{aligned}$ | Description |
| :---: | :---: | :---: | :---: |
| Network <br> address <br> Setting | $\begin{gathered} \text { SW1 } \\ \text { b7—b1 } \end{gathered}$ | 0000000 | Cannot be used |
|  |  | 0000001 | Network address is 1 |
|  |  | 0000010 | Network address is 2 |
|  |  | 0000011 | Network address is 3 |
|  |  | ........... | ........... |
|  |  | 1111110 | Network address is 126 |
|  |  | 1111111 | Network address is 127 |
| CANopen Transmission rate setting | $\begin{gathered} \text { SW2 } \\ \text { b3—b1 } \end{gathered}$ | 000 | 10K |
|  |  | 001 | 20K |
|  |  | 010 | 50K |
|  |  | 011 | 125K |
|  |  | 100 | 250K |
|  |  | 101 | 500K |
|  |  | 110 | 800K |
|  |  | 111 | 1M |

Network address switch setting range: 1~127 (0, 128~255 cannot be used).
Transmission rate switch setting range: 0~7 (8~15 cannot be used).

### 11.10.4 LED indicator descriptions

The module has RUN (green) and ERR (red) indicators built-in used to quickly diagnose and monitor the communication statuses between the module itself and the bus.

## Module status LED (RUN LED)

Used to monitor whether the equipment is operating normally.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :---: |
| Does not light <br> up | Initial status | Power not supplied |
| Continuous <br> flashing | Pre-operation | Preparation status |
| Single flash | Stop | Stopping |
| Green light <br> lights up | Operation | Operating |

## Error status LED (ERR LED)

Used to monitor the operability of the communication module CANopen network.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :---: |
| Does not light <br> up | No error | Operating |
| Single flash | Warning | Packet error |
| Double flash | Error | Guard/Heartbeat error |
| Red light lights <br> up | Disconnected | Bus closed |

### 11.10.5 Driver parameter setting descriptions

Used to monitor the operability of the communication module CANopen network. Users must first confirm related parameter settings on the driver in order to ensure that the communication module can connect normally.

| Parameters | Parameter name | Settings | Settings descriptions |
| :---: | :---: | :---: | :---: |
| $00-02$ | Operation command source | 2 | Communication control |
| $00-05$ | Frequency command source | 3 | Communication control |

### 11.10.6 Connection instructions

## Service data object (SDO)

This module supports 1 SDO server, which means it can provide SDO service, and the SDO uses the sending and receiving COB-ID of the predefined connection, $0 \times 580+$ NodeID (sending) and 0x600 + NodeID (receiving).
Each SDO message includes a set of COB-ID (request SDO and response SDO); it allows performing of access actions within two nodes. SDO can transmit any size of data, but segment transmission must be used once it exceeds 4 bytes.

The COB IDs of SDO communication are as follows:
Read: Master to slave (request code 0x40) / Master to slave: $600 \mathrm{H}+$ Node ID

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} (600 \mathrm{H})+\text { Node } \\ \text { ID } \end{gathered}$ | Reque st code | Object index |  | Object subind ex | Request data |  |  |  |
|  |  | LSB | MSB |  |  | Res |  |  |

Read: Slave response / slave to master: 580H + Node ID

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Reque | Object index |  | Object subind ex | Request data |  |  |  |
| ID | st code | LSB | MSB |  | $\begin{gathered} \text { bit0~ } \\ \text { bit7 } \end{gathered}$ | $\begin{aligned} & \text { Bit8~ } \\ & \text { bit15 } \end{aligned}$ | Bit16~ bit23 | $\begin{gathered} \text { Bit24~ } \\ \text { bit31 } \end{gathered}$ |

Response code:
43H: Read 4-byte data / 4BH: read 2-byte data / 4FH: read 1-byte data

Write: Master to slave (4-byte data maximum)

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(600 H)+$ Node <br> ID | Reque <br> st | Object index |  | Object | Request data |  |  |  |
|  | code | LSB | MSB | subind <br> ex | bit0~ <br> bit7 | Bit8~ <br> bit15 | Bit16~ <br> bit23 | Bit24~ <br> bit31 |

Request code:
23H: Write a 4-byte data entry
2BH: Write a 2-byte data entry
2FH: Write a 1-byte data entry

Write: Slave to master (response code $0 \times 60 \mathrm{H}$ )

| COB-ID | Byte0 | Byte1 | Byte2 | Byte3 | Byte4 | Byte5 | Byte6 | Byte7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{gathered} (580 \mathrm{H})+\text { Node } \\ \text { ID } \end{gathered}$ | Reque st code | Object index |  | Object subind ex | Request data |  |  |  |
|  |  | LSB | MSB |  | Reserved |  |  |  |

When we use SDO to perform control to the group 25 H of the driver control group, corresponding rules are as follows:

| Index |
| :---: |
| $25 \times x H$ (register |
| address) |

For example, when we want to perform write/read to 2501 H of the control group, the corresponding SDO object index is the control group register address 2501 H .
Perform operation with index 2501 H directly and the module will automatically convert to the A510s 2501 H control group register address to perform operation.

### 11.10.7 Object index list

Basic index

| Index | Sub | Name | Default value | R/W | Size | Remarks |

### 11.10.8 Troubleshooting

There are two indicators on top of the CANopen communication module; when malfunction occurs, the cause of the malfunction can be confirmed based on the indicator statuses, and troubleshoot the error by following the descriptions below.

Indicator troubleshooting

## Module status LED (RUN LED)

| Indicator <br> statuses | Status name | Troubleshooting method |
| :---: | :--- | :--- |
| Does not <br> light up | Power not supplied to <br> the communication <br> module | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the <br> driver. |

Error status LED (ERR LED)

| Indicator <br> statuses | Status name | Description |
| :---: | :--- | :--- |
| Single <br> flash | CANopen packet error | Poor connection quality with the CANopen host <br> terminal or host not connected when powered <br> on. Continue transmission or power off <br> inspection can be selected. Two results can be <br> expected with continue transmission 1) Packet <br> transmission returns to normal and the red light <br> no longer flashes 2) Packet continues to have <br> errors causing disconnection. When the power is <br> off, check whether the TB1 terminal and cable <br> are firmly connected, and whether the <br> transmission rate, maximum transmission <br> distance and cable length comply with ODVA <br> specifications. |
| Double <br> flash | Guard/Heartbeat error | User sends periodic heartbeat messages. If a <br> message is not received after a specific time, <br> please disconnect the power and check the <br> connection status of that node. |

|  |  | Cannot connect with the CANopen host <br> terminal; disconnect the power and check <br> Red light <br> lights up |
| :--- | :--- | :--- |
| Disconnected | whether the TB1 terminal and cable is firmly <br> connected, and whether the transmission rate, <br> maximum transmission distance and cable <br> length comply with ODVA specifications. |  |

### 11.10.9 EDS file

When using the CANopen communication module, if the EDS description file (JN5-CMHI-CAN_V (latest version).eds) is needed, please download it from the TECO official website or request for it from your purchasing sales channel.

### 11.11 Introduction to the EtherCAT high speed

 communication expansion module
### 11.11.1 Communication hardware and data structure

This product is the EtherCAT high-speed communication expansion module (hereinafter referred to as communication module); it can perform remote setting and communication functions through the EtherCAT network environment. It can only be used with the TECO A510s/F510 AC motor driver (hereinafter referred to as a driver), and allow the driver to operate on the EtherCAT network.

### 11.11.2 Product specifications

## EtherCAT ports

| Item | Specifications |
| :---: | :--- |
| Connector | Dual-port network socket |
| Network | EtherCAT communication protocol |
| protocols |  |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Control board CN2 connector |
| Terminal | 1. The communication module communicates with the AC motor <br> driver through this interface. |
| functions | 2. The AC motor driver provides power to the communication <br> module through this interface. |

### 11.11.3 Installation instructions

## Communication module contact description

As shown in the figure below, the framed part is the CN2 connector that connects to the driver.

## Communication module network socket

As shown in the figure below, the left socket is input and the right socket is output.

## Driver parameter setting description

Users must first confirm related parameter settings on the driver in order to ensure that the communication module can connect normally.

| Parameters | Parameter name | Settings | Settings descriptions |
| :---: | :---: | :---: | :---: |
| $00-02$ | Operation command source | 2 | Communication control |
| $00-05$ | Frequency command source | 3 | Communication control |

### 11.11.4 LED indicator descriptions

The module has two dual-color LED indicators built-in used to quickly diagnose and monitor the communication statuses between the module itself and the EtherCAT network.

## Module status LED2

Used to monitor whether the communication module is operating normally.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :--- |
| Does not <br> light up | Power not supplied | Power not supplied |
| Red light <br> flashes | Data transmitting | Driver and communication <br> expansion module data transmitting |
| Red/green <br> light lights <br> up | Driver data <br> transmission error | Data transmission error between the <br> driver and communication expansion <br> module |

Network status LED1
Used to monitor the operability of the communication module EtherCAT network.

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :---: |
| Does not <br> light up | Not connected / <br> INIT | EtherCAT network not connected <br> (INIT) |
| Green light <br> flashes | Standby | Preparation status (Pre-OP) |
| Green light <br> lights up | Operation status | Operation status (OP) |
| Red light <br> lights up | Driver data <br> transmission error | Data transmission error between the <br> driver and communication expansion <br> module |

### 11.11.5 Object index list

Basic index

### 11.11.6 Troubleshooting

There are two indicators on top of the EtherCAT communication module. When a malfunction occurs, the cause of the malfunction can be confirmed based on the indicator statuses, and troubleshoot the error by following the descriptions below.

Indicator troubleshooting

## Module status LED2

| Indicator <br> statuses | Status name | Troubleshooting method |
| :---: | :---: | :--- |
| Does not <br> light up | Power not supplied | 1. Confirm whether the driver power is normal. <br> 2. Confirm whether the power terminal of the <br> communication module is connected to the <br> driver. |
| Red/green <br> light lights <br> up | Driver data <br> transmission error | 1. Confirm whether the communication module <br> has proper contact. <br> 2. Reconnect the power of the driver and <br> confirm whether the error has been eliminated. |

Network status LED1

| Indicator <br> statuses | Status name | Description |
| :---: | :---: | :--- |
| Does not <br> light up | Not connected / INIT | 1. Confirm whether the driver power is normal. <br> 2. If connected to EtherCAT, confirm whether it is <br> in INIT mode. |
| Red light <br> lights up | Driver data <br> transmission error | 1. Confirm whether the communication module <br> has proper contact. <br> 2. Reconnect the power of the driver and confirm <br> whether the error has been eliminated. |

### 11.11.7 xml file

When using the EtherCAT communication module, if the xml description file (JN5-CMHI-ECAT_V (latest version).xml) is needed, please download it from the TECO official website or request for it from your purchasing sales channel.

### 11.12 I/O expansion card

### 11.12.1 Hardware and data structure

This product is an I/O expansion module; it allows performing of I/O expansion functions through the SPI bus. Used with the TECO A510s/F510 AC motor driver (hereinafter referred to as a driver).

### 11.12.2 Product specifications

I/O ports

| Item | Specifications |  |
| :---: | :---: | :---: |
| Connector | TB1 $\quad 7$ external contacts |  |

## AC motor driver port

| Item | Specifications |
| :---: | :--- |
| Connector | Control board CN2 connector/CN5 connector |
| Transmission <br> method | SPI high speed communication |
| Terminal <br> functions | TB1 7 external contacts |

### 11.12.3 Installation instructions

## Contact description

| Type | Terminal | Terminal functions | Signal level |
| :---: | :---: | :--- | :--- |
| Analog <br> input <br> signal | Al3 | Main speed command input; SW7 can be used to switch <br> between voltage or current input <br> $(-10 \sim 10 \mathrm{~V}) /(4-20 \mathrm{~mA})$ | -10 V to +10 V, <br> (Input resistance 500K $\Omega)$ <br> 4 to 20 mA <br> (Input resistance: 500 $)$ |

### 11.12.4 Driver parameter setting descriptions

Please refer to group 3, 4 parameter descriptions in the manual

### 11.13 DC reactor

Installing a DC reactor at the DC terminal of the frequency converter provides the following advantages:

- Improves the input current waveform distortion caused by the rectifier in the frequency converter while maintaining continuous rectified current.
- Suppresses instantaneous current surges and prevents related overheating phenomenon caused by the rectifier and voltage regulator components due to instantaneous current surges.
- Reduces harmonic interference problems generated by the frequency converter.
- Improves and increase power factor and reduces AC component pulses at the DC terminal.
- Compared to AC reactors, the size of DC reactors are smaller and the costs are also lower.

Table 6.13 DC reactor list

| Model |  |  | DC reactor |  |

|  | 425 (built-in) | 585/585 | 0.08 | 800 |

Note: When using DC reactors, please first remove the short-circuit copper sheet between the P1 and P2 terminals, and then fix the current reactor on these two terminals.

### 11.14 Sinusoidal output reactor

The parasitic inductance and capacitance that exist in the frequency converter and motor wiring are determined by the component switching speed and wiring of the frequency converter. The voltage of the motor terminal will reach as high as twice the DC voltage of the frequency converter. LC resonance may cause surge voltages at the motor terminal and cause danger. Installing an AC reactor at the frequency converter output can suppress voltages (dv/dt). If the wiring length is too long, suppression of surge voltages will become more difficult. Installing a sinusoidal output filter at the output terminal of the frequency converter can prevent the motor terminal voltage from generating surges.

Table 6.14 Sinusoidal output reactor list

| Model |  |  | Output reactor |  |
| :---: | :---: | :---: | :---: | :---: |
| V | HP | Rated current <br> (A) <br> HD/ND | Inductance value $(\mathrm{mH})$ | Rated current (A) |

| V | HP | $\begin{array}{c}\text { Rated current } \\ \text { (A) } \\ \text { HD/ND }\end{array}$ | $\begin{array}{c}\text { Inductance value } \\ \text { (mH) }\end{array}$ | Rated current (A) |$]$

Note: 1. The frequency converter has improved IGBT equipment and soft-switching driver circuit; compared to previous models, it can improve dv/dt by approximately 50\% terminal voltage.
2. The purposes of installing sinusoidal output filters are as follows:

- Prolong motor life.
- Reduce motor interference.
- Reduce frequency converter pulse load.
- Improve system stability and efficiency.

### 11.15 DC24V power expansion card

This product allows parts of the communication or driver functions to operate normally before connecting power to the frequency converter.

### 11.15.1 JN5-PS-DC24V product specifications

Connection terminal

| Item | Specifications |

## Appendix B: UL Instructions

| Danger |
| :--- |
| Electric Shock Hazard |
| Do not connect or disconnect wiring while the power is on. |
| Failure to comply will result in death or serious injury. |

## Warning

## Electric Shock Hazard

Do not operate equipment with covers removed.
Failure to comply could result in death or serious injury.
The diagrams in this section may show inverters without covers or safety shields to show details. Be sure to reinstall covers or shields before operating the inverters and run the inverters according to the instructions described in this manual.

## Always ground the motor-side grounding terminal.

Improper equipment grounding could result in death or serious injury by contacting the motor case.
Do not touch any terminals before the capacitors have fully discharged.
Failure to comply could result in death or serious injury.
Before wiring terminals, disconnect all power to the equipment. The internal capacitor remains charged even after the power supply is turned off. After shutting off the power, wait for at least the amount of time specified on the inverter before touching any components.

Do not allow unqualified personnel to perform work on the inverter.
Failure to comply could result in death or serious injury.
Installation, maintenance, inspection, and servicing must be performed only by authorized personnel familiar with installation, adjustment, and maintenance of inverters.

Do not perform work on the inverter while wearing loose clothing, jewelry, or lack of eye protection. Failure to comply could result in death or serious injury.
Remove all metal objects such as watches and rings, secure loose clothing, and wear eye protection before beginning work on the inverter.

Do not remove covers or touch circuit boards while the power is on.
Failure to comply could result in death or serious injury.

## Warning

## Fire Hazard

Tighten all terminal screws to the specified tightening torque.
Loose electrical connections could result in death or serious injury by fire due to overheating of electrical connections.

## Do not use an improper voltage source.

Failure to comply could result in death or serious injury by fire.
Verify that the rated voltage of the inverter matches the voltage of the incoming power supply before applying power.

Do not use improper combustible materials.
Failure to comply could result in death or serious injury by fire. Attach the inverter to metal or other noncombustible material.

## NOTICE

Observe proper electrostatic discharge procedures (ESD) when handling the inverter and circuit boards.
Failure to comply may result in ESD damage to the inverter circuitry.
Never connect or disconnect the motor from the inverter while the inverter is outputting voltage. Improper equipment sequencing could result in damage to the inverter.

## Do not use unshielded cable for control wiring.

Failure to comply may cause electrical interference resulting in poor system performance. Use shielded twisted-pair wires and ground the shield to the ground terminal of the inverter.

Do not modify the inverter circuitry.
Failure to comply could result in damage to the inverter and will void warranty.Teco is not responsible for any modification of the product made by the user. This product must not be modified.

Check all the wiring to ensure that all connections are correct after installing the inverter and connecting any other devices.
Failure to comply could result in damage to the inverter.

## * UL Standards

The UL/cUL mark applies to products in the United States and Canada and it means that UL has performed product testing and evaluation and determined that their stringent standards for product safety have been met. For a product to receive UL certification, all components inside that product must also receive UL certification.

UL/cUL Mark

## * UL Standards Compliance

This inverter is tested in accordance with UL standard UL508C and complies with UL requirements. To ensure continued compliance when using this inverter in combination with other equipment, meet the following conditions:

## - Installation Area

Do not install the inverter to an area greater than pollution severity 2 (UL standard).

## Main Circuit Terminal Wiring

UL approval requires crimp terminals when wiring the inverter's main circuit terminals. Use crimping tools as specified by the crimp terminal manufacturer. Teco recommends crimp terminals made by NICHIFU for the insulation cap.
The table below matches inverter models with crimp terminals and insulation caps. Orders can be placed with a Teco representative or directly with the Teco sales department.

Closed-Loop Crimp Terminal Size

| Drive ModelA510S (F) | Wire Gauge mm2, (AWG) | Terminal | Crimp Terminal | Tool | Insulation Cap |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Screws | Model ${ }^{\text {No. }}$ | Machine No. | Model No. |
| 4001/4002/4003 | 2 (14) | M4 | R2-4 | Nichifu NH 1 / 9 | TIC 2 |
|  | 3.5 (12) |  | R5.5-4 |  | TIC 3.5 |
|  | 5.5 (10) |  |  |  | TIC 5.5 |
| 4005/4008 | 3.5 (12) | M4 | R5.5-4 | Nichifu NH 1 / 9 | TIC 3.5 |
|  | 5.5 (10) |  |  |  | TIC 5.5 |

## * Motor Overtemperature Protection

Motor overtemperature protection shall be provided in the end use application.

## Field Wiring Terminals

All input and output field wiring terminals not located within the motor circuit shall be marked to indicate the proper connections that are to be made to each terminal and indicate that copper conductors, rated $75^{\circ} \mathrm{C}$ are to be used.

This inverter has undergone the UL short-circuit test, which certifies that during a short circuit in the power supply the current flow will not rise above value. Please see electrical ratings for maximum voltage and table below for current.

- The MCCB and breaker protection and fuse ratings (refer to the preceding table) shall be equal to or greater than the short-circuit tolerance of the power supply being used.
- Suitable for use on a circuit capable of delivering not more than (A) RMS symmetrical amperes for.DiJ2.IHp in 240 / 480 V class drives motor overload protection.

| Horse Power (Hp) | Current (A) | Voltage (V) |
| :---: | :---: | :---: |
| $1-50$ | 5,000 | $240 / 480$ |
| $51-200$ | 10,000 | $240 / 480$ |
| $201-400$ | 18,000 | $240 / 480$ |
| $401-600$ | 30,000 | $240 / 480$ |

## * Inverter Motor Overload Protection

Set parameter 02-0 I (motor rated current) to the appropriate value to enable motor overload protection. The internal motor overload protection is UL listed and in accordance with the NEC and CEC.

02-01 Motor Rated Current

Setting Range Model Dependent
Factory Default: Model Dependent

The motor rated current parameter (02-0) protects the motor and allows for proper vector control when using open loop vector or flux vector control methods ( $00-00=2$ or 3 ). The motor protection parameter $08-05$ is set as factory default. Set $02-01$ to the full load amps (FLA) stamped on the nameplate of the motor. The operator must enter the rated current of the motor (17-02) in the menu during auto-tuning. If the auto-tuning operation completes successfully ( $17-00=0$ ), the value entered into 17-02 will automatically write into 02-0 I .

## 08-05 Motor Overload Protection Selection

The inverter has an electronic overload protection function (OL1) based on time, output current, and output frequency, which protects the motor from overheating. The electronic thermal overload function is UL-recognized, so it does not require an external thermal overload relay for single motor operation. This parameter selects the motor overload curve used according to the type of motor applied.

| $\mathbf{0 8 - 0 5}$ | Selection for motor overload protection (OL1) |
| :---: | :--- |
|  | xxx0b: Motor overload is invalid <br> Rxx1b: Motor overload is valid <br> Range <br>  <br> xx0xb: Cold start of motor overload <br> xx1xb: Hot start of motor overload <br> x0xxb: Standard motor <br> x1xxb: Special motor <br> 0xxxb: Reserved <br> 1xxxb: Reserved |

Sets the motor overload protection function in 08-05 according to the applicable motor.

08-05 = ---OB: Disables the motor overload protection function when two or more motors are connected to a single inverter. Use an alternative method to provide separate overload protection for each motor such as connecting a thermal overload relay to 1 he power line of each motor.

08-05 = --1-B: The motor overload protection function should be set to hot start protection characteristic curve when the power supply is turned on and off frequently, because the thermal values are reset each time when the power is turned off.
$08-05=-0-\mathrm{B}$ : For motors without a forced cooling fan (general purpose standard motor), the heat dissipation capability is lower when in low speed operation.

08-05 =-1—B: For motors with a forced cooling fan (inverter duty or VIF motor), the heat dissipation capability is not dependent upon the rotating speed.

To protect the motor from overload by using electronic overload protection, be sure to set parameter 02-01 according to the rated current value shown on the motor nameplate.
Refer to the following "Motor Overload Protection Time" for the standard motor overload protection curve example: Setting 08-05 $=-0-\mathrm{B}$.

## 08-06 Motor Overload Operation Selection

| $\mathbf{0 8 - 0 6}$ | Start-up mode of overload protection operation (OL1) |
| :---: | :--- |
| Range | 0: Stop output after overload protection <br> 1: Continuous operation after overload protection. |

08-06=0: When the inverter detects a motor overload the inverter output is turned off and the OL1 fault message will flash on the keypad. Press RESET button on the keypad or activate the reset function through the multi-function inputs to reset the OL1 fault.

08-06=1: When the inverter detects a motor overload the inverter will continue running and the OL1 alarm message will flash on the keypad until the motor current falls within the normal operating range.
